

# AGENDA 2063

## First Ten Year Implementation Plan

## Core Indicators Profile Handbook

Draft Revised Version – February 2021

# Contents

LIST OF ACRONYMS .....	ii
Acknowledgements .....	iii
Overview of Aspirations and Indicators .....	4
Goal 1: A High Standard of Living, Quality of Life and Well Being for All.....	8
Goal 2: Well Educated Citizens and Skills revolution underpinned by Science, Technology and Innovation.....	27
Goal 3: Healthy and Well-Nourished Citizens .....	36
Goal 4: Transformed Economies and Job Creation .....	56
Goal 5: Modern Agriculture for increased productivity and production .....	64
Goal 6: Blue/ ocean economy for accelerated economic growth.....	67
Goal 7: Environmentally sustainable climate resilient economies and communities.....	70
Goal 8: United Africa (Federal or Confederate) .....	78
Goal 9: Key Continental Financial and Monetary Institutions established and functional...	82
Goal 10: World Class Infrastructure criss-crosses Africa .....	85
Goal 11: Democratic values, practices, universal principles of human rights, justice and the rule of law entrenched .....	93
Goal 12: Capable institutions and transformed leadership in place at all levels.....	98
Goal 13: Peace, Security and Stability are preserved .....	101
Goal 14: A Stable and Peaceful Africa.....	103
Goal 15: A Fully Functional and Operational African Peace and Security Architecture ....	105
Goal 16: African Cultural Renaissance is Pre-eminent .....	108
Goal 17: Full Gender Equality in All Spheres of Life.....	111
Goal 18: Engaged and Empowered Youth and Children .....	117
Goal 19: Africa as a major partner in global affairs and peaceful co-existence.....	125
Goal 20: Africa takes full responsibility for financing her development.....	130

# LIST OF ACRONYMS

ART	Antiretroviral Therapy
ARV	Antiretroviral
AU	African Union
AUC	African Union Commission
COMESA	Common Market for Eastern and Southern Africa
CRING	Country Reports on Indicators for the Goals
DHS	Demographic Health Survey
EAC	East African Community;
ECLAC	Economic Commission for Latin America and the Caribbean
FGM/C	Female Genital Mutilation/Cutting
FIES	Food Insecurity Experience Scale
GDP	Gross Domestic Product
GER	Gross Enrolment Rate
GNI	Gross National Income
HIV	Human Immunodeficiency Virus
IASB	International Accounting Standards Board
IFRS	International Financial Reporting Standards
ILO	The International Labour Organisation
IMF	International Monetary Fund
ISIC	International Standard Industrial Classification
LSMS	Living Standards Measurement Surveys
M&E	Monitoring and Evaluation
MDG(s)	Millennium Development Goal(s)
MICs	Multiple Indicator Cluster Surveys
MMR	Maternal Mortality Ratio
MVA	Manufacturing value added
NCSH	National Centre for Health Statistics
NER	Net Enrolment Rate
NTBs	Non-tariff barriers
ODA	Oversees Development Assistance
PPP	Purchasing Power Parity
R&D	Research and Development
RECs	Regional Economic Communities
SADC	Southern Africa Development Community
SDGs	Sustainable Development Goals
SLM	Sustainable land management
SRH	Sexual Reproductive Health
STEM	Science or Technology or Engineering or Mathematics
STI	Science, Technology and Innovation
STIs	Sexually Transmitted Infections
TB	Tuberculosis
TFTA	Tripartite Free Trade Agreement
UNICEF	United Nations Children's Fund
UN-IGME	The United Nation Inter-agency Group for Child Mortality Estimation
WHO	World Health Organisation
WHS	World Health Survey
WIPO	World Intellectual Property Organization),
WTO	World Trade Organization

# Acknowledgements

This handbook was developed in response to a mandate by the African Union to the African Union Commission (AUC) and the African Union Development Agency (AUDA – NEPAD), to develop a comprehensive Monitoring and Evaluation System for Agenda 2063 First Ten Year Implementation Plan. The handbook was developed as part of the work of developing a cascading system that will inform monitoring, evaluation, reporting and learning of Africa's development blueprint- Agenda 2063 and the global Sustainable Development Goals (SDGs) at the different levels from global to sub-national levels.

A Joint Task team was constituted, drawn from different institutions in Africa, charged with providing oversight to the development of the handbook. Subsequently, a Technical Working Group, comprised of experts in Monitoring and Evaluation undertook the process of developing the handbook under the leadership of the African Union Commission and the AUDA – NEPAD. The handbook received rich input at various platforms from a range of stakeholders, as part of the process of validation.

Special thanks go to the Joint Task Team for the strategic guidance and support that was provided to the Technical Working Group. Appreciation also goes out to all those who took part in the validation process of the handbook. Furthermore, the support of the Management of AUC and AUDA - NEPAD - committing both financial resources and also making available technical staff who provided technical leadership in the entire process of developing the handbook, is recognised.

The invaluable input made by the members of the Technical Working Group merits high recognition. In this regard, recognition is made of the Technical Working Group members, namely: Messa-Gavo Edem (ACBF); McBride Nkhalamba (APRM); Adou Jean Yeaves (APRM); Oitsile Sethunyiwe (AUC); Shumba Tichawona (AUC); Admore Chakadenga (AUC); Josephine Etima (AUC); Selamawit Mussie (AUC); Addu Boahene Yaw (Consultant – AUC); Panyako Simon Oswan (COMESA); Manirakiza Samson (EAC); Nadege Muhimpundu (EAC); Kourma Mamadi (CEN-SAD); Moussavou Mbina Pascal (ECCAS); TOUKA Tchakonte Jules (ECCAS); Olalekan Samuel Afolabi (ECOWAS); Rachel Mbaria (IGAD); Anthony Awira (IGAD); Dagmore Tawonezvi (SADC); Abibu Tamu (JSSO); Edmond Oladipo (JSSO); Mohamed Abdisalam (AUDA - NEPAD); Florence Nazare (AUDA - NEPAD); Martin Bwalya (AUDA - NEPAD); Simon Kisira (AUDA - NEPAD); Alex Diouf (Consultant – AUDA - NEPAD); Vipya Harawa (PAP); Emmanuel Afedor (PAP); Ibrahim Cherno Jagne (PAP); Lina Henao (SDG Centre for Africa); MOUNIR Benhammou Mohamed (UMA); Bartholomew Amah (UNECA); and Negussie Gorfe (UNECA).

During the revision of the Handbook, invaluable input and guidance was received from the Team of the Champion on Agenda 2063 – H.E Alassane Ouattara, President of the Republic of Côte d'Ivoire. The Team, led by Madam Nialé KABA, Minister of Planning and Development and also the Champion's national Focal Point of Agenda 2063, included Dr Nahoua YEO – The Chief of Staff of Minister of Planning and Development, Mr Marcelin CISSE, Director General of Development Planning; Mr Gninnakan Oumar SAKO, Strategic Planner, Monitoring and Evaluation specialist, and Mr Arouna Diallo, Expert. Additional insights were received from the State Department for Planning of the Government of Kenya and from the NEPAD Kenya Office, with compilation of the input coordinated by Mr James Maina and Mr Taubman Olang respectively.

## Introduction

This Agenda 2063 First Ten Year Implementation Plan (FTYIP) Core Indicator Handbook is part of the FTYIP Monitoring and Evaluation Framework. The AU Summit of June 2015 that adopted the FTYIP directed that an M&E Framework be developed and used by Member States, RECs, AU Organs, and Continental Stakeholders as UN-ECA, AfDB to ensure that the results expected at all levels of the FTYIP execution are tracked.

The M&E Framework document outlines the principles, the stakeholder responsibilities, the tools / platforms and other factors which guide in monitoring and evaluating the implementation of Agenda 2063. For purposes of credible comparison and peer learning across countries, there is need to standardise the parameters that are measured and reported against. It is against this background that a set of core indicators was selected through an inclusive and highly consultative process among all key stakeholders of Agenda 2063. The core indicators have been profiled to granular levels and packaged into this Handbook.

## Purpose of the Handbook

This Handbook has been developed to serve the following purposes:

- To indicate to all stakeholders the areas of the Results Framework of the FTYIP which should be reported on by all AU Member States;
- To provide a standardized measurement process and attendant tools that will guide AU Member States in preparing their reports on the implementation of Agenda 2063; and
- To serve as guide in data collection, analysis and reporting on the implementation of Agenda 2063 FTYIP.

## Preparation and Validation Process

The preparation of this Handbook was undertaken by a Technical Team comprising Planners, M&E Experts and Statisticians from the AUC and AUDA - NEPAD, the Pan African Parliament, RECs, UN-Economic Commission for Africa, the African Development Bank, The African Peer Review Mechanism, the African Capacity Building Foundation, and Member States. The process of developing the Handbook was led by AUC and AUDA – NEPAD.

The Handbook underwent validation went through three main stages. Firstly, there was a review of the output of the Technical Team by Director Generals' of Planning Ministries/Agencies of Member States and Planners/M&E Experts from the RECs. Subsequently, the outputs of this meeting were presented to the Special Technical Committee (STC) of the AU on Finance, Economy, Planning and Integration of the African Union for their review. Finally, the AU Organs, namely the Ministerial Committee on Agenda 2063, the Executive Council and the African Assembly reviewed and adopted the Handbook.

## Selection of the Core Indicators

While the First Ten Year Implementation Plan results framework has **140** indicators, there was consensus among the stakeholders to have a smaller number that will be tracked and reported on. Accordingly, 66 indicators were selected, thereafter referred to as **Core Indicators**, and all Member States and RECs were encouraged to report on biennially. Member States were also encouraged to track non-Core Indicators - depending on their development priorities.

In selecting the core indicators, the following criteria were used:

- Flagship Projects: all indicators related to the 12 flagship projects of the FTYIP were selected.
- Transformation Indicators: the FTYIP places premium on transformation in the following areas: science, technology and innovation skills revolution, job creating value addition, manufacturing, women and youth employment and empowerment etc. To this end, indicators that measure progress in these areas were selected
- Integration Indicators: indicators of factors that foster the integration of the continent – trade, movement of people, connectivity – road, rail, air, internet etc were selected.
- Convergence with SDGs: without sacrificing the intent of the target under the FTYIP, efforts were made to have common indicators between the FTYIP targets and the corresponding / near corresponding targets of the SDGs. This was done to foster single reporting by AU Member States on both Agenda 2063 FTYIP and the SDGs. It is noteworthy that seventy percent of Agenda 2063 core indicators also feature as indicators of SDGs in corresponding thematic areas.
- Higher level indicators: impact and outcome indicators (depending on the circumstance) were also selected
- National systems capabilities: A review of national plans and visions of AU Member States during the preparation of the Agenda 2063 Framework Document provided valuable insights of existing capabilities in the collection of data for monitoring and evaluation purposes. These insights influenced the selection of the core indicators.

A review of the process of preparing the First Continental Report on Agenda 2063 highlighted the need to refine some of the core indicators. Subsequently, the list of core indicators has increased from 66 to 72. Each of the indicators has been profiled and presented in a standardised structure framed as indicator reference sheets.

## **The Indicator Reference Sheets**

A detailed exposition of each of the core indicators has been provided, following a standardized structure. The structured granular profiling provides systematic guidance to Member States, RECs and AU continental institutions in data collection and analysis on the core indicators. For ease of reference, each indicator has a reference number.

### Reference number

An indicator with the reference number **A1-G3-P1-T2-I3** features the following:

- A1 - Aspiration 1 of Agenda 2063
- G3 - Goal 3 under Aspiration 1;
- P1 - Priority Area 1 under Goal 3;
- T2 - Target 2 under Priority Area 1 of Goal 3;
- I3 - The 3<sup>rd</sup> indicator out of the 72 core indicators.

## **Structure of the Document**

The Handbook is structured along the seven aspirations of Agenda 2063-FTYIP, namely:

1. A Prosperous Africa based on inclusive growth and sustainable development
2. An integrated Continent, Politically United and based on the Ideals of Pan Africanism and Vision of the African Renaissance
3. An Africa of Good Governance, Democracy, Respect for Human Rights, Justice and the Rule of Law
4. A Peaceful and Secure Africa
5. Africa with strong Cultural Identity, Common Heritage, Values and Ethics
6. An Africa whose development is People driven, relying on the Potential of the African People
7. An Africa as strong and influential Global Partner

Each of these seven chapters start with a summary table that shows the goal(s), the associated priority areas, the corresponding targets under each priority area and indicator for the targets. Where applicable, the reference number of the corresponding SDG indicator is provided. The summary table is then followed by reference sheets of indicators that fall under that aspiration.

# Overview of Aspirations and Indicators

<b>ASPIRATION 1: A PROSPEROUS AFRICA BASED ON INCLUSIVE GROWTH AND SUSTAINABLE DEVELOPMENT</b>		
<b>Goal 1: A High Standard of Living, Quality of Life and Well Being for All</b>		
<b>Priority Area</b>	<b>Agenda 2063 Target</b>	<b>Indicators</b>
1. Incomes, Jobs and decent Work	Increase 2013 per capita income by at least 30%	Real GDP per capita
	Reduce 2013 unemployment rate by at least 25%	Unemployment rate
	Reduce Youth and Women unemployment rate by 2% per annum	
	Reduce 2013 unemployment rate for vulnerable groups by at least 25%	
2. Poverty, Inequality and Hunger	Reduce 2013 income inequality level by at least 20%	Gini coefficient
	Reduce 2013 levels of poverty by at least 30%	% of population living below the national poverty line
	Reduce 2013 level of proportion of the population without access to safe drinking water by 95%.	
	Reduce 2013 levels of proportion of the population who suffer from hunger by at least 80%	Prevalence of undernourishment
3. Modern and Liveable Habitats and Basic Quality Services	Reduce 2013 level of proportion of the population without access to safe drinking water by 95%.	% of population with access to safe drinking water
	Increase access and use of electricity and internet by at least 50% of the 2013 levels	a)% of population with access to electricity
		b)% of population with access to internet
		c) % of population using internet
	Reduce Slums by at least 10%	Proportion of urban population living in slums or informal settlements
Reduce the proportion of the population with poor sanitation facilities by 95%	% of population using safely managed sanitation services	
<b>Goal 2: Well Educated Citizens and Skills revolution underpinned by Science, Technology and Innovation</b>		
1. Education and STI driven Skills Revolution	Enrolment rate for early childhood education is at least 300% of the 2013 rate	% of children in pre-school age attending pre school
	Enrolment rate for basic education is 100%	Net enrolment rate in primary education
	Increase the number of qualified teachers by at least 30% with focus on STEM	Proportion of teachers qualified in Science or Technology or Engineering or Mathematics
	Universal secondary school (including technical high schools) with enrolment rate of 100%	Secondary school net enrolment rate
<b>Goal 3: Healthy and Well-Nourished Citizens</b>		
1. Health and Nutrition	Increase 2013 levels of access to sexual and reproductive health services to women by at least 30%	% of women in the reproductive age 15-49 who have access to sexual and reproductive health service in the last one year
	Reduce 2013 maternal, neo-natal and child mortality rates by at least 50%	a) Maternal mortality ratio
		b) Neo-natal mortality rate
		c) Under five mortality rate
		d) % of deliveries attended to by skilled personnel
	Reduce the 2013 incidence of HIV/AIDs, Malaria and TB by at least 80%	Number of new HIV infections per 1000 population
Tuberculosis incidence per 1000 persons per year		
Malaria incidence per 1000 persons per year		
Access to Anti-Retroviral (ARV) drugs is 100%	% of eligible population with HIV having access to Anti-Retroviral Treatment (ART)	
Reduce stunting in children to 10% and underweight to 5%.	Prevalence of underweight among children under 5	
<b>Goal 4: Transformed Economies and Job Creation</b>		
1. Sustainable inclusive economic growth	1. Annual GDP growth rate of at least 7%	GDP Growth Rate
2. STI driven Manufacturing / Industrialization and Value Addition	2. Real value of manufacturing in GDP is 50% more than the 2013 level.	Research and development expenditure as a proportion of GDP
3. Economic diversification and resilience	3. At least 1% of GDP is allocated to science, technology and innovation research and STI driven entrepreneurship development.	Manufacturing value added as a % of GDP
4. Hospitality / Tourism	4. Contribution of tourism to GDP in real terms is increased by at least 100%.	Tourism value added as a proportion of GDP

<b>Goal 5: Modern Agriculture for increased productivity and production</b>		
1. Agricultural productivity and production	Double agricultural total factor productivity	Growth rate of yields for the five national priority commodities
<b>Goal 6: Blue/ ocean economy for accelerated economic growth</b>		
1. Marine resources and Energy	At least 50% increase in value addition in the fishery sector in real term is attained by 2023	Fishery Sector value added as share of GDP
	Marine bio-technology contribution to GDP is increased in real terms by at least 50% from the 2013 levels	Marine biotechnology value added as a % of GDP
<b>Goal 7: Environmentally sustainable climate resilient economies and communities</b>		
1. Bio-diversity, conservation and sustainable natural resource management.	At least 30% of agricultural land is placed under sustainable land management practice	% of agricultural land placed under sustainable land management practice.
	At least 17% of terrestrial and inland water and 10% of coastal and marine areas are preserved	a) % of terrestrial and inland water areas preserved. b) % of coastal and marine areas preserved
<b>ASPIRATION 2: AN INTEGRATED CONTINENT, POLITICALLY UNITED AND BASED ON THE IDEALS OF PAN- AFRICANISM AND A VISION OF AFRICAN RENAISSANCE</b>		
<b>Goal 8: United Africa (Federal or Confederate)</b>		
1. Political and economic Integration	Active member of the African Free Trade Area	Proportion of reported NTBs that have been eliminated
	Volume of intra-African trade is at least three times the 2013 level	% change in value of intra-African trade per annum
<b>Goal 9: Key Continental Financial and Monetary Institutions established and functional</b>		
1. Financial and Monetary Institutions	1. Fast track realization of the African Continental Free Trade Area (AfCFTA) by 2017	Extent to which AU Member States have domesticated the African Continental Free Trade Area (AfCFTA)
	2. AU Monetary Union established by 2023	Number of countries that have ratified the protocol on the establishment of the AU Monetary Union
<b>Goal 10: World Class Infrastructure criss-crosses Africa</b>		
1. Communications and Infrastructure Connectivity	At least national readiness for implementation of the trans African Highway Missing link is achieved	% of progress made on the implementation of Trans-African Highway Missing link
	At least national readiness for in country connectivity to the African High Speed Rail Network is achieved by 2019	% of progress made on the implementation the African High Speed Rail Network
	Skies fully opened to African airlines (Original indicator was: # of protocols on African open skies implemented. We may need to review the proposed indicators)	a) Number of AU Member States that have signed the Solemn Commitment to join the SAATM and implement all its measures
		b) Number of AU Member States that have signed the Memorandum of operationalizing the SAATM
	Increase electricity generation and distribution by at least 50% by 2020	No. of Mega Watts added to the national grid in the last two years
	Double ICT penetration and contribution to GDP	Proportion of population using mobile technology for communication eg mobile phones, ipads, computers, laptops % contribution of ICT to GDP
<b>ASPIRATION 3: AN AFRICA OF GOOD GOVERNANCE, DEMOCRACY, RESPECT FOR HUMAN RIGHTS, JUSTICE AND THE RULE OF LAW</b>		
<b>Goal 11: Democratic values, practices, universal principles of human rights, justice and the rule of law entrenched</b>		
1. Democratic Values and Practices are the Norm	At least 70% of the people believe that they are empowered and are holding their leaders accountable	% of people who believe that there are effective mechanisms and oversight institutions to hold their leaders accountable
	At least 70% of the people perceive that the press / information is free and freedom of expression pertains	% of people who perceive that there is press freedom
	At least 70% of the public perceive elections are free, fair and transparent	% of people who believe that the elections are free, fair and transparent.
	African Charter on Democracy is signed, ratified and domesticated by 2020	Extent to which the African Charter on democracy has been domesticated

<b>Goal 12: Capable institutions and transformed leadership in place at all levels</b>		
1. Institutions and Leadership	At least 70% of the public acknowledge the public service to be professional, efficient, responsive, accountable, impartial and corruption free	Proportion of persons who had at least one contact with a public / private official and asked or paid a bribe during the previous twelve months
<b>ASPIRATION 4: A PEACEFUL AND SECURE AFRICA</b>		
<b>Goal 13: Peace, Security and Stability are preserved</b>		
1. Maintenance and Restoration of Peace and Security	Level of conflict emanating from ethnicity, all forms of exclusion, religious and political differences is at most 50% of 2013 levels.	Conflict related deaths per 100,000 population
<b>Goal 14: A Stable and Peaceful Africa</b>		
1. Institutional Structure for AU Instruments on Peace and Security	Silence All Guns by 2020	% change in the number of armed conflicts
<b>Goal 15: A Fully Functional and Operational African Peace and Security Architecture</b>		
1. Operationalization of APSA Pillars	National Peace Council is established by 2016	Existence of an operational national peace council
<b>ASPIRATION 5: AFRICA WITH A STRONG CULTURAL IDENTITY, COMMON HERITAGE, VALUES AND ETHICS</b>		
<b>Goal 16: African Cultural Renaissance is pre-eminent</b>		
1. Values and Ideals of Pan Africanism	At least 60% of content in educational curriculum is on indigenous African culture, values and language targeting primary and secondary schools	Proportion of the content of the curricula on indigenous African culture, values and language in primary and secondary schools
<b>ASPIRATION 6. AN AFRICA WHOSE DEVELOPMENT IS PEOPLE DRIVEN, RELYING ON THE POTENTIAL OF THE AFRICAN PEOPLE</b>		
<b>Goal 17: Full Gender Equality in All Spheres of Life</b>		
1. Women Empowerment	Equal economic rights for women, including the rights to own and inherit property, sign a contract, save, register and manage a business and own and operate a bank account by 2026	Proportion of women in total agricultural population with ownership or secure rights over agricultural land
	At least 30% of all elected officials at local, regional and national levels are Women as well as in judicial institutions	Proportion of seats held by women in national parliaments, regional and local bodies
2. Violence & Discrimination against Women and Girls	Reduce 2013 levels of violence against women and Girls by at least 20%	Proportion of women and girls subjected to sexual and physical violence
	Reduce by 50% all harmful social norms and customary practices against women and girls and those that promote violence and discrimination against women and girls	Proportion of girls and women who have undergone female genital mutilation / cutting
	Eliminate all barriers to quality education, health and social services for Women and Girls by 2020	Proportion of children whose births are registered in the first year
<b>Goal 18: Engaged and Empowered Youth and Children</b>		
1. Youth Empowerment and Children's Rights	Reduce 2013 rate of youth unemployment by at least 25%; in particular female youth	Unemployment rate among the youth
	End all forms of violence, child labour exploitation, child marriage and human trafficking	% of children engaged in child labour
		% of children engaged in child marriage
		% of children who are victims of human trafficking
Full implementation of the provision of African Charter on the Rights of the Youth is attained	Level of implementation of the provisions of the African Charter on the Rights of the Youth by Member States	
<b>ASPIRATION 7: AFRICA AS A STRONG AND INFLUENTIAL GLOBAL PARTNER</b>		
<b>Goal 19: Africa as a major partner in global affairs and peaceful co-existence</b>		
1. Africa's place in global affairs	National statistical system fully functional	Availability of national legislation on statistics that complies with fundamental principles of official statistics
		Proportion of national budget allocated for the implementation of functional statistical system
		Existence of formal institutional arrangements for the coordination of the compilation of official statistics
<b>Goal 20: Africa takes full responsibility for financing her development</b>		
1. Capital Markets	National capital market finances at least 10% of development expenditure	Proportion of public sector budget funded by national capital markets
2. Fiscal system and Public Sector Revenues	Tax and non-tax revenue of all levels of government should cover at least 75% of current and development expenditure	Total tax revenue as a % of GDP
3. Development Assistance	Proportion of aid in the national budget is at most 25% of 2013 level	Total ODA as a percentage of the national budget
		Resources raised through innovative financing mechanisms as a % of national budget

# **ASPIRATION 1:**

**A PROSPEROUS AFRICA BASED  
ON INCLUSIVE GROWTH AND  
SUSTAINABLE DEVELOPMENT**

## Goal 1: A High Standard of Living, Quality of Life and Well Being for All

Agenda 2063			Corresponding SDG Indicator
Priority Area	Target	Indicator	
1. Incomes, Jobs and decent work	1. Increase 2013 per capita income by at least 30%	Real GDP per capita	8.1.1
	2. Reduce 2013 unemployment rate by at least 25%	Unemployment rate	8.5.2
	3. Reduce Youth and Women unemployment rate by 2% per annum		
	4. Reduce 2013 unemployment rate for vulnerable groups by at least 25%		
2. Poverty, Inequality and Hunger	1. Improve the 2013 Gini Coefficient by at least 20%	Gini coefficient	10.2.1
	2. Reduce 2013 levels of poverty by at least 30%.	% of population living below the national poverty line	
	3. Reduce 2013 levels of proportion of the population who suffer from hunger by at least 80%	Prevalence of undernourishment	
3. Modern and Liveable Habitats and Basic Quality Services	1. Reduce 2013 level of proportion of the population without access to safe drinking water by 95%.	% of population with access to safe drinking water	6.1.1
	2. Increase access and use of electricity and internet by at least 50% of the 2013 levels	a) % of population with access to electricity	7.1.1
		b) % of population with access to internet	
		c) % of population using internet	
	3. Reduce slums by at least 10%.	% of urban population living in slums, informal settlements or inadequate housing	11.1.1
	4. Reduce 2013 level of proportion of the population with poor sanitation facilities by 95%	% of population using safely managed sanitation services	6.1.2

<b>Indicator 1: Real GDP per capita</b>
<b>Indicator Reference: A1 - G1 – P1 – T1 – I1</b>
<b>DESCRIPTION</b>
<p><b>Definition</b></p> <p>Real Gross Domestic Product (GDP) per capita is the measure of total economic output of a country divided by the number of people and adjusted for inflation.</p> <p><b>Clarification</b></p> <p>Real GDP per capita is a proxy for the average standard of living of residents in a country or area. A positive percentage change in annual real GDP per capita can be interpreted as an increase in the average standard of living of the residents in the country or area under study.</p> <p>Gross Domestic Product (GDP), also called nominal GDP, is a measure of economic output, specifically summing up the monetary value of all final goods and services produced in a country in a given period of time. It is calculated without making deductions for depreciation of fabricated assets, or for depletion and degradation of natural resources.</p> <p>GDP statistics are normally benchmark indicators for progress, development and welfare for any given economic sector at national level. Effectiveness of national policies is measured and monitored using disaggregated GDP statistics. In addition, GDP data is the primary input for assessing economic integration progress at regional and continental level, in particular, for macroeconomic convergence targets.</p> <p>GDP can be measured using the expenditure approach as the sum of expenditure on final consumption plus gross capital formation plus exports less imports. It can also be calculated using the production approach as the value of output less intermediate consumption plus any taxes less subsidies on products not already included in the value of outputs. Furthermore, GDP can be measured using the income approach as the sum of compensation of employees, gross operating surplus, gross mixed incomes and taxes less subsidies on both production and imports.</p> <p>For performance measurements, however, Real GDP is a preferred performance indicator over nominal GDP for a more accurate assessment as its computation takes into consideration the effects of inflation over the period of time in question using a price deflator. The deflator is the ratio of what goods and services would cost today if there had been no inflation since the base year.</p> <p><b>Computation Formula</b></p> <p>Real Gross Domestic Product (GDP) per capita is calculated as follows:</p> <ol style="list-style-type: none"> <li>Calculate the nominal GDP at year t</li> <li>Get the price deflator for 2013 (the base year).</li> <li>Divide the nominal GDP by the price deflator</li> <li>Divide the results of c) above by the population of the country.</li> </ol> <p>Real GDP per capita = <math>\left[ \frac{\text{Nominal GDP}}{\text{Price deflator}} \right]</math> divided by country's population</p>
<b>Unit of measurement:</b> GDP per capita at constant 2013 prices
<b>Disaggregated by:</b> Not applicable

**Indicator 2: Unemployment rate****Indicator Reference: A1 – G1 – P1 – T2 - I2:****DESCRIPTION****Definition:**

Unemployment rate is the number of unemployed people as a percentage of the labour force. The labour force comprises all persons currently available for work and actively seeking work, and is the sum of those that are employed and unemployed.

**Clarification**

According to the International Labour Organization (ILO) definition of unemployment, the “unemployed” comprise all persons above the age specified for measuring the economically active population, who during the reference period satisfy the following three conditions simultaneously:

- “Without work” i.e., not in paid employment or self-employment, as specified by the international definition of employment;
- “Currently available for work” i.e., available for paid employment or self-employment during the reference period (or shortly after); and
- “Seeking work” i.e., had taken specific steps in a specified recent period (typically the last four weeks) to seek paid employment or self-employment.

A special provision applies to persons without work who made arrangements to start work at a date subsequent to the reference period (future starts). These persons are classified as “unemployed” irrespective of their job-search activity, provided they were without work during the reference period and currently available for work.

“Seeking work” means taking active steps to look for work such as registration at public or private employment exchanges, direct application to employers, checking at worksites, farms, factory gates, market or other assembly places, placing or answering newspaper advertisements, seeking assistance of friends or relatives, looking for financial resources, land, building, machinery or equipment, or permits or licenses to establish own enterprise.

**Computation Formula**

$$\text{Unemployment Rate} = \frac{\text{Number of Unemployed Persons}}{\text{Total Number of Persons in the Labour Force}} \times 100$$

**Unit of measurement:**

- Person(s)

**Disaggregated by:**

- Age
- Sex: Male, Female
- Rural/Urban

**PLAN FOR DATA ACQUISITION****Data Collection method:**

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

When unemployment is high, some people become discouraged and stop looking for work; they are then excluded from the labour force. This implies that the unemployment rate may fall, or stop rising, even though there has been no underlying improvement in the labour market.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 3: Gini Coefficient****Indicator Reference: A1 – G1 – P2 – T1 – I3****DESCRIPTION****Definition:**

The Gini Coefficient (Gini index or Gini ratio) is a statistical measure of economic inequality in a population. The Coefficient measures the dispersion of income or distribution of wealth among the members of a population.

**Clarification**

The Gini coefficient is one of the most frequently used measures of economic inequality. The Gini index can take any values between 0 and 1 and becomes a Gini Coefficient expressed as a percentage (0% to 100%). A coefficient of zero indicates a perfectly equal distribution of income or wealth within a population. A coefficient of 100 represents a perfect inequality when one person in a population receives all the income, while the other people earn nothing. In addition, in some rare cases, the coefficient can exceed 100%. This may theoretically occur when the income or wealth of a population is negative.

**Computation Formula****Steps to Calculate the Gini Coefficient**

The formula for the Gini coefficient can be calculated by using the following five simple steps:

**Step 1:** Organize the data into a table with the category head mentioned below.

Fraction of Income	Fraction of Population	% of Population that is richer	Score
--------------------	------------------------	--------------------------------	-------

It is important to note that all the rows have to be organized from the poorest to the richest. For instance, if it is stated that the bottom 10% of the population earns 3% of income, write 0.03 in the 'Fraction of Income' column. Next, write 0.10 in the 'Fraction of Population' column. Similarly, fill these 2 columns with other percentages given.

**Step 2:** Fill '% of Population that is richer' column by adding all terms in 'Fraction of Population' below that row.

Fraction of Income	Fraction of Population	% of Population that is richer	Score
0.03	0.1	0.9	
0.15	0.5	0.4	
0.85	0.4	0	

For instance, in order to fill the first row in '% of Population that is richer' column, we will add 0.50 and 0.40, which are the rows in 'fraction of population' below it, which is 0.90.

**Step 3:** Calculate the Score for each of the rows. The formula for Score is:

**Score = Fraction of Income \* (Fraction of Population + 2 \* % of Population that is richer).**

For instance, score for the 1<sup>st</sup> row is  $0.03 \times (0.10 + 2 \times 0.90) = 0.057$

**Step 4:** Next, add all the terms in the 'Score' column. Let us call it 'Sum'

**Step 5:** Calculate the Gini coefficient using the formula:  $= 1 - \text{Sum}$

**Unit of measurement:**

- Values or percentage

**Disaggregated by:**

Not Applicable

## PLAN FOR DATA ACQUISITION

**Data Collection method:** National surveys (usually produced with national living conditions data) and censuses

**Data Source:**

- National Statistics Offices

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Reported through national household surveys

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any): The Gini coefficient measured for a large economically diverse country will generally result in a much higher coefficient than each of its regions has individually. For this reason the scores calculated for individual countries within the continent are difficult to compare with the score of the the continent e.g Europe.

**Actions Taken or Planned to Address Data Limitations:** Data entered by Member States will be from national surveys conducted by National Statistical Bureaus or Offices which is collected in line with international requirements.

**Indicator 4: Percentage of population living below the national poverty line****Indicator Reference: A1 – G1 – P2 – T2 – I4****DESCRIPTION****Definition:**

The percentage of the population living below the poverty line, or called the incidence of poverty, is the simplest measure of poverty. It is the percentage of the population whose standard of living is below the poverty line. This poverty line corresponds to the percentage of nominal median income.

**Clarification**

The Index provides information on the evolution of poverty through the counting of individuals living below acceptable social minimums. The incidence also provides an assessment of the overall impact of anti-poverty policies.

The indicator is the ratio of the number of poor individuals to the total population

The poverty line can be defined in absolute terms (based on a minimum consumption basket) or relative terms (as a percentage of median or average income). This threshold takes on radically different values depending on the calculation option chosen for the country.

**Computation Formula**

$$\text{Percentage of population below poverty line} = \frac{\text{Population below poverty line}}{\text{Total Population}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- age
- Sex
- Rural / Urban

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Consumer budget survey, household survey, QUIBB

**Data Source:**

- National household surveys

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Every five years

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

This indicator alone is not a sufficient measure for monitoring the decline in poverty. It must be said that the numerical poverty index is only sensitive to the number of the poor, and hence this indicator does not take into account any information on the evolution of the situation of the poor.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 5: Prevalence of undernourishment****Indicator Reference: A1 – G1 – P2 – T3 – I5****DESCRIPTION****Definition:**

The **prevalence of undernourishment** (PoU) is an estimate of the proportion of the population whose habitual food consumption is insufficient to provide the dietary energy levels that are required to maintain a normal active and healthy life. It is expressed as a percentage.

**Clarification**

The Prevalence of Undernourishment (PoU) is a national-level model-based indicator used to understand access to food in terms of dietary energy inadequacy. It measures the percentage of the population whose dietary energy intake is below the Minimum Dietary Energy Requirement (MDER). This indicator is produced yearly by the Food and Agriculture Organization (FAO). For global monitoring purposes (given the lack of nationally representative individual dietary intake surveys available, for all countries), it is produced using information on dietary energy supply from the Food Balance Sheet (FBS) data.

**Computation Formula**

$$\text{Prevalence of Undernourishment} = \frac{\text{Number of people below the minimal dietary energy requirement}}{\text{Total population surveyed}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Rural / Urban

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- 

**Data Source:**

- National household surveys and official Food Security Surveys, Food balance sheets

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Reported annually

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 6: Percentage of population with access to safe drinking water****Indicator Reference: A1 – G1 – P3 – T1 – I6****DESCRIPTION****Definition:**

The share of the population that uses any type of safe drinking water supplies.

**Clarification**

An improved drinking water source is a facility that, by nature of its construction, is protected from outside contamination - in particular from contamination with faecal matter. Improved drinking water sources include: piped water into dwelling, plot or yard; public tap/standpipe; borehole/tube well; protected dug well; protected spring; rainwater collection and bottled water. Users of bottled water are considered to have access to improved sources only when they have a secondary source which is of an otherwise improved type. Improved drinking water sources do not include unprotected wells, unprotected springs, water provided by carts with small tanks/drums, tanker truck-provided water and bottled water (if the secondary source is not improved) or surface water taken directly from rivers, ponds, streams, lakes, dams, or irrigation channels.

Drinking water is defined as water used for ingestion, food preparation and basic hygiene purposes.

Use of an improved drinking water source is a proxy for measuring access to safe drinking water. Improved drinking water sources are more likely to be protected from external contaminants than unimproved sources either by intervention or through their design and construction. Greater access to improved drinking water sources is important as it contributes to lowering the incidence of many diseases in developing countries. This indicator does not specify a minimum available amount of water per capita per day, nor does it specify a distance to the source expressed either in the amount of time required to collect water or the actual distance in meters.

**Computation Formula**

Percentage of population with access to safe drinking water =  $\frac{\text{number of people who use an improved water source}}{\text{total population}} \times 100$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Urban, rural

**PLAN FOR DATA ACQUISITION****Data Collection method:**

Sample surveys and censuses provide an estimate of what sources of water are actually used by the population interviewed, at the time of measurement, including those constructed by different actors and excluding those that have fallen into disrepair and are no longer in use. For these reasons, data from surveys and censuses are deemed more reliable and objective than administrative records.

In order to classify drinking water service categories as “improved” or “not improved”, data need to be collected by facility type. DHS and MICS surveys use the MDG classification of improved and unimproved drinking water sources as their standard response categories. Other sample survey instruments and censuses are encouraged to use a similar classification.

Insufficient disaggregation of service categories is the most common problem for adequately assessing progress using this indicator. From 2008, the World Health Organization/United Nations Children’s Fund (WHO/UNICEF) Joint Monitoring Programme for Water Supply and Sanitation (JMP) started separated drinking water sources into three categories:

- Piped connections on premises (into dwelling, plot or yard)
- Other improved drinking water sources

- Unimproved water sources

The JMP estimate separates “surface water” from the unimproved water sources.

Trends in the use of these categories provide valuable information to programme managers and policy makers, but trend analysis is possible only when an adequate level of disaggregation of service categories is included in surveys.

Increasingly, people use bottled water as their main source of drinking water. Since bottled water is largely used for ingestion only, the DHS and MICS have included an additional question to determine what secondary source is used for other household purposes such as cooking or hand washing. Failure to record such information may mask the fact that many users of bottled water have access to piped drinking water as well.

**Data Source:**

Nationally representative household surveys that typically collect information about water and sanitation include Multiple Indicator Cluster Surveys (MICS), Demographic Health Surveys (DHS), World Health Surveys (WHS), Living Standards and Measurement Surveys (LSMS), Core Welfare Indicator Questionnaires (CWIQ), and the Pan Arab Project for Family Health Surveys (PAPFAM). The survey questions and response categories pertaining to access to drinking water are fully harmonized between MICS and DHS.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

The timeframe for the DHS and MICS surveys in any given country will be different. The DHS is implemented every 5 years, the MICS every 3 years, and the MICS does not always include mortality data. These surveys are not conducted on an annual basis in any given country so reporting on this indicator for a specific country can only be done when the above surveys are scheduled, which could be every 3-5 years.

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

Given the lack of nationally representative data on drinking water quality and safety and the high costs and technical difficulties of collecting such information at a large scale, the Inter-agency Expert Group on MDG Indicators endorsed the use of this indicator on the use of an improved drinking water source as a proxy for access to safe drinking water

The proxy indicator does not reflect the time spent on getting water from improved sources not on premises. Sustainable access is currently not measured for reasons of a lack of common understanding of what constitutes sustainable access and how to reliably measure it.

The actual quality of source water is not measured directly and instead only assumed and thus may vary based on how well a specific source is protected.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 7: Percentage of households with access to electricity****Indicator Reference: A1 – G1 – P3 – T2 – I7****DESCRIPTION****Definition:**

Number of households that can be connected to the national electricity grid system (or any alternative source of energy such as solar, private generator, windmill) as a percentage of total number of households

**Clarification**

While there is no universally-adopted definition of what ‘access to electricity’ means, most definitions are aligned to the delivery of electricity and its consumption at household level.

The total national electricity supply is given at a point in time. The number of households and their average consumption patterns are normally determined by the national electricity suppliers, providers or planners.

Based on these, an assessment is made as to how the existing electricity supply could cover national households.

The assessment does not take into account the number of households that are connected to the national grid because of affordability.

Governments need the assessment to develop and implement policies / strategies to ensure adequate supply of electricity at all times to satisfy household demands.

**Computation Formula**

$$\% \text{ of household with access to electricity} = \frac{\text{Total No. of households that are connected to any source of electricity}}{\text{Total number of households}} \times 100$$

**Disaggregated by:**

- Urban, rural

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- National Household Surveys
- National Census.

**Data Source:**

- National Statistical Office for survey on households
- National Population Council / Authorities for Surveys on Households
- Ministries of Energy / Planning / National Electricity Regulatory Authorities for national electricity generation capacity

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 8: Percentage of households using electricity****Indicator Reference: A1 – G1 – P3 – T3 – I8**

## DESCRIPTION

**Definition**

Proportion of households using electricity from the grid or off grid connectors [or any alternative source of energy such as solar, private generator, windmill,...] as a percentage of total number of households

**Clarification**

Modern energy services are an essential component of providing adequate food, shelter, water, sanitation, medical care, education and access to communication. Lack of access to modern energy services contributes to poverty and deprivation and limits economic development. Furthermore, adequate, affordable and reliable energy services are necessary to guarantee sustainable economic and human development.

**Computation Formula**

$$\text{Percentage of household using electricity} = \frac{\text{Total No. of households using electricity from the grid, off-grid connectors or other alternative sources of energy}}{\text{Total number of households}} \times 100$$

**Disaggregated by:**

- Urban, rural

## PLAN FOR DATA ACQUISITION

**Data Collection methods:**

- National Service Delivery Surveys
- National Household Surveys
- National Census.

**Data Source:**

- National Statistical Office for survey on households
- National Population Council / Authorities for Surveys on Households
- Ministries of Energy / Planning / National Electricity Regulatory Authorities for national electricity generation capacity

- Other publicly available statistics, including US Agency for International Development (USAID) supported DHS survey data, the World Bank's Living Standards Measurement Surveys (LSMS)

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 8: Percentage of population with access to the internet****Indicator Reference: A1 – G1 – P3 – T2 – I8****DESCRIPTION****Definition**

The share of the population that has access to the internet as a percentage of total population.

**Clarification**

The Internet is a worldwide public computer network. It provides access to a number of communication services including the World Wide Web and carries e-mail, news, entertainment and data files, irrespective of the device used (not assumed to be only via a computer - it may also be by mobile-cellular telephone, other wireless devices, games machine, digital TV etc.). Access can be via a fixed or mobile network.

Individuals having access and using the Internet refers to those that had access and used the Internet in the last 12 months from any location.

Internet access, and in particular broadband Internet access, has become a key infrastructure, a key pillar to industrialization and a fundamental driver for innovation. It is an important driver for economic growth and development and can help foster wellbeing, in particular by delivering a growing number of services and applications, including in the areas of business, health, education and governance.

This indicator is important for monitoring progress on the availability of the benefits of new technologies (especially information and communication), because effective communication between those involved in the development process is not possible without the necessary infrastructure. Internet allows people to exchange experiences and learn from each other, enabling higher returns on investment and avoiding problems of duplication or missing information. The use of information and communication technologies can make governments more transparent, thereby reducing corruption and leading to better governance. It can help people in rural areas find out about market prices and sell their products at a better price. It can also overcome traditional barriers to better education by making books available online and opening the door to e-learning.

Besides outlining the use of the Internet, this indicator is able to measure changes in Internet access and use. In countries where many people access the Internet at work, at school, at cybercafés or other public locations, increases in public access serve to increase the number of users despite limited numbers of Internet subscriptions and of households with Internet access. Developing countries tend to have many Internet users per Internet subscriptions, meaning that home access is not the primary location of access.

**Computation Formula**
$$\text{Percentage of population with access to the internet} = \frac{\text{Popn with access to Internet}}{\text{Total Eligible Population}} \times 100$$
**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Age
- Sex (Male, female)
- Urban, rural

**PLAN FOR DATA ACQUISITION**

**Data Collection method:**

A growing number of countries are measuring the percentage of individuals using the Internet through household surveys. Surveys usually indicate a percentage of the population for a certain age range (e.g. over 10 years old). The percentage of individuals using the Internet in this age range is used to estimate the percentage of individuals using the Internet for the entire population. Where surveys are not available, an estimate of the percentage of individuals using the Internet may be derived based on a number of indicators such as fixed (wired)-broadband subscriptions, fixed-telephone subscriptions, active mobile-broadband subscriptions and the income of the country.

**Data Source:**

- Data are based on surveys generally carried out by national statistical offices or estimated based on the number of Internet subscriptions.
- National household surveys
- User surveys conducted by national statistical agencies or industry associations
- Internet user statistics are based largely on responses to an annual questionnaire that the International Telecommunication Union (ITU) sends to government telecommunication agencies (<http://www.itu.int/ITU-D/ict/datacollection/>)
- Partnership on Measuring ICT for Development's Core List of Indicators, which has been endorsed by the UN Statistical Commission

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

While the data on the percentage of individuals using the Internet are very reliable for countries that have carried out official household surveys, they are much less reliable in cases where the number of Internet users is estimated based on the number of Internet subscriptions. The data can be misleading because of multiple prepaid Internet accounts, free Internet access accounts or public Internet access such as Internet cafes. The methodology used to estimate the percentage of individuals using the Internet should always be described when presenting the data.

The quality of the Internet user data varies, and the quality of data for smaller developing countries is uncertain.

**Actions Taken or Planned to Address Data Limitations:**

Household surveys

**Indicator 9: Percentage of population using internet****Indicator Reference: A1 – G1 – P3 – T2 – I9****DESCRIPTION****Definition:**

This indicator refers to the percentage of the population with access and using internet.

**Clarification**

The Internet is a worldwide public computer network. It provides access to a number of communication services including the World Wide Web and carries e-mail, news, entertainment and data files, irrespective of the device used (not assumed to be only via a computer - it may also be by mobile-cellular telephone, other wireless devices, games machine, digital TV etc.). Access can be via a fixed or mobile network.

Individuals having access and using the Internet refers to those that had access and used the Internet in the last 12 months from any location.

Internet access, and in particular broadband Internet access, has become a key infrastructure, a key pillar to industrialization and a fundamental driver for innovation. It is an important driver for economic growth and development and can help foster wellbeing, in particular by delivering a growing number of services and applications, including in the areas of business, health, education and governance.

This indicator is an important tool for monitoring progress on the availability of the benefits of new technologies (especially information and communications), because effective communication between those involved in the development process is not possible without the necessary infrastructure. Internet allows people to exchange experiences and learn from each other, enabling higher returns on investment and avoiding problems of duplication or missing information. The use of information and communication technologies can make governments more transparent, thereby reducing corruption and leading to better governance. It can help people in rural areas find out about market prices and sell their products at a better price. It can also overcome traditional barriers to better education by making books available online and opening the door to e-learning.

Besides capturing the use of the Internet, this indicator is able to measure changes in Internet access and use. In countries where many people access the Internet at work, at school, at cybercafés or other public locations, increases in public access serve to increase the number of users despite limited numbers of Internet subscriptions and of households with Internet access. Developing countries especially tend to have many Internet users per Internet subscriptions, reflecting that home access is not the primary location of access.

The methodology used to estimate the percentage of individuals using the Internet should always be described when presenting the data.

The quality of the Internet user data varies, and the quality of data for smaller developing countries is uncertain.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 10: Proportion of Urban population living in slums or informal settlements****Indicator Reference: A1 - G1 – P3 – T3 – I10****DESCRIPTION**

## Definition

A slum household is a household that lacks one or more of the following:

- Access to basic water (access to sufficient amount of water for family use, at an affordable price, available to household members without being subject to extreme effort)
- Access to basic sanitation (access to an excreta disposal system, either in the form of a private toilet or a public toilet shared with a reasonable number of people)
- Security of tenure (evidence of documentation to prove secure tenure status or de facto or perceived protection from evictions)
- Durability of housing (permanent and adequate structure in non-hazardous location)
- Sufficient living area (not more than two people sharing the same room)

Computation Formula = 
$$\frac{\text{Total number of people living in slums of all the cities of a country}}{\text{Total population living in all the cities of the given country}}$$

**Unit of measurement:** Percentage**Disaggregated by:** By sex of head of household and age

## PLAN FOR DATA ACQUISITION

**Data Collection method:**

- Household surveys and citizen/community-run surveys

**Data Source:**

- Country statistics bureaus
- UN-Habitat and the Global City Indicators Facility

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):

Not all slums are the same and not all slum dwellers suffer from the same degree of deprivation. The degree of deprivation depends on how many of the five conditions that define slums are prevalent within a slum household.

**Actions Taken or Planned to Address Data Limitations:**

*This is to be elaborated and cleared by the technical experts of the sub-committee on Urban Development and Human Settlements of the African Union Specialized Technical Committee on Public Service, Local Government, Urban Development and Decentralization*

**Indicator 11: Percentage of population using safely managed sanitation services****Indicator Reference: A1 - G1 – P3 – T4 – I11****DESCRIPTION**Definition:

This is the percentage of people using improved sanitation facilities that are not shared with other households and where excreta are safely disposed of in situ or transported and treated offsite.

Clarification

The indicator measures the percentage of the population in urban and rural areas using safely managed sanitation services, as defined by the WHO/UNICEF Joint Monitoring Programme.

Safely managed sanitation services are those that effectively separate excreta from human contact, and ensure that excreta do not re-enter the immediate environment. This means that household excreta are contained, extracted, and transported to designated disposal or treatment site, or, as locally appropriate, are safely re-used at the household or community level. Each of the following types of facilities are considered adequate if the facility is not shared with other households: a pit latrine with a superstructure, and a platform or squatting slab constructed of durable material (composting latrines, pour-flush latrines, etc.); a toilet connected to a septic tank; or a toilet connected to a sewer network (small bore or conventional).

Source: Sustainable Development Solutions Network <https://indicators.report/indicators/i-46/>

Computation:

The population using safely managed sanitation services is calculated as the sum of three groups: (1) The population using sewer connections which are not shared and deliver excreta to treatment plants where they receive treatment; (2) The population using non-sewered sanitation facilities which are not shared and are emptied, and the excreta are transported and treated off-site, (3) The population using non-sewered sanitation facilities which are not shared and are not emptied, and the excreta are considered safely disposed of in situ.

Computation Formula = 
$$\frac{\text{Population using safely managed sanitation services}}{\text{Total population that was sampled}}$$

**Unit of measurement:** Percentage**Disaggregated by:**

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

## Goal 2: Well Educated Citizens and Skills revolution underpinned by Science, Technology and Innovation

Agenda 2063			Corresponding SDG Target
Priority area	Target	Indicator	
1. Education and STI driven Skills Revolution	1. Enrolment rate for early childhood education is at least 300% of the 2013 rate	% of children in pre-school age attending pre school	
	2. Enrolment rate for basic education is 100%	Net enrolment rate in primary education	
	3. Increase the number of qualified teachers by at least 30% with focus on STEM	Proportion of teachers qualified in Science or Technology or Engineering or Mathematics	4.c.1
	4. At least 1% of GDP is allocated to science, technology and innovation research and STI driven entrepreneurship development.	Research and development expenditure as a proportion of GDP	9.5.1
	5. Universal secondary school (including technical high schools) with enrolment rate of 100%	Net enrolment rates in secondary school	

**Indicator 12: Percentage of children in pre-school age attending pre-school****Indicator Reference: A1 – G2 – P1 - T1– I12****DESCRIPTION****Definition:**

The percentage of children in pre-school age attending preschool is defined as the total number of official pre-primary age children enrolled in pre-primary education as a percentage of the total population in the official pre-primary education age bracket.

**Clarification**

Pre-primary (or pre-school) education (ISCED 0) is defined as the initial stage of organized instruction, designed primarily to introduce very young children to a school-type environment, that is, to provide a bridge between home and a school-based atmosphere. ISCED level 0 programmes should be center or school-based, be designed to meet the educational and developmental needs of children at least three years of age, and have staff that are adequately trained (i.e., qualified) to provide an educational programme for the children.

Education is a process by which human beings and societies reach their fullest potential. Education is critical for promoting sustainable development and improving the capacity of people to address environment and social economic development issues. It is critical for achieving ethical awareness, values, and skills consistent with sustainable development and effective public participation in decision-making. As such education of every age cohort is key in realising demographic dividends as it empowers people to be productive, innovative and employable.

Policy-makers concerned with children's access and participation in education need the indicator to determine the level of effort required to achieve set goals in national development plans. Inadequate preparation at pre-school age has been shown to have impact on affective and cognitive development as well as achievement in later years. The goal is for all pre-school age children to access formal education by 2030

**Computation Formula**

$$\text{Percentage of children in pre-school age attending preschool} = \frac{\text{Number of children of the official pre-school age enrolled in pre-school education}}{\text{Total number of pre-school age children}} \times 100$$

**Unit of measurement**

- Percentage

**Disaggregated by:**

- Sex (Male, female)
- Age
- Geographic location

**PLAN FOR DATA ACQUISITION****Data Collection methods:**

- Surveys on number of children of official pre-school age enrolled in pre-school education
- Estimates of number of children within the pre-school age – using birth registration records

**Data Source:**

- Ministry's Educational Management Information System annual statistical reports
- Population estimates / projections from National Population Commissions.
- AU Education Observatory

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

Lack of accurate data is a major problem when operationalizing the indicator.

Population figures are estimated and enrolment data is subject to tabulation errors and missing data.

Inaccurate population estimates and less than 100% returns of school questionnaires make enrolment rates unreliable.

Inadequate data collection applications

**Actions Taken or Planned to Address Data Limitations:**

- Development of online data collection software
- Capacity strengthening of Member States in data management
- Strengthen national and continental EMIS ecosystems

## Indicator 13: Net enrolment rate in primary education

Indicator Reference: A1 – G2 – P1 - T2– I13

### DESCRIPTION

#### Definition:

Net enrolment rate in primary education is defined as the number of children of official primary school age (according to International Standard Classification of Education, ISCED), who are enrolled in primary education as a percentage of the total number of children of the official primary school age population.

#### Clarification

This indicator is often analysed alongside the Gross Enrolment Ratio for Primary Education (GER).

The customary or legal age of entrance to primary school is not younger than five years or older than seven years and in principle covers between six to eight years of full-time schooling. Where more than one system of primary education exists within a country, the most widespread or common structure is used for determining the official school age group. Primary education typically lasts until age 10 to 15.

Primary education normally consists of programmes designed on a unit or project basis to give pupils a sound basic education in reading, writing and mathematics along with an elementary understanding of other subjects such as history, geography, natural science, social science, art and music. Life-skills are also taught including socialisation and sexuality education in the later years of primary school.

Access to primary education is an accepted human right.

Net Enrolment Rate is considered to be a measure of the education coverage in a specific level of a country's education system.

Policy-makers concerned with children's access and participation in education would find this indicator, alongside the GER (defined later in "Linkages to Other Indicators"), particularly useful. A sharp discrepancy between the GER and the NER indicates that enrolled children enter late to the first grade or do not progress regularly through the grades and that the system's internal efficiency could be improved. Appropriate policies and measures could then be adopted to address problems of grade repetition and drop-out as well as bottlenecks with regard to retention in school.

This level of education is compulsory and therefore the indicator checks compliance to this accepted requirement.

#### Computation Formula

To calculate the indicator, it is necessary to first determine the population of official primary school age, preferably by reference to the theoretical starting age and duration of ISCED97 Level 1 (primary education), for international comparability. Then, the number of pupils of the official primary school age who are enrolled in primary education is divided by the population for the same age group and the result is multiplied by 100.

$$NER_p^t = \frac{E_{p,a}^t}{P_{p,a}^t} \times 100$$

where:

$NER_p^t$  = Net enrolment rate in primary education p in school year t

$E_{p,a}^t$  = Enrolment of the population of age group a in primary education p in school year t

$P_{p,a}^t$  = Population of age group a, which officially corresponds to primary education p in school year t

Net enrolment rates below 100 per cent provide a measure of the proportion of primary school age children who are not enrolled in primary school. Values below 100 alert policy makers to the need for policies that increase primary school enrolment in order to achieve the goal of Universal Primary Education. Policies can target different populations of children depending on the characteristics of un-enrolled children. Some children may have entered school and then dropped out in subsequent years requiring policies to increase retention rates. Other children may never have entered school requiring policies that increase the economic, social or physical accessibility of schools.

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Sex (Male, female)
- Age
- Geographic location

**PLAN FOR DATA ACQUISITION**

**Data Collection methods:**

- Review secondary data from the Ministry's Educational Management Information System and annual statistical reports
- Periodic surveys on basic education.

**Data Source:**

- Ministry's Educational Management Information Systems
- Annual statistical reports on basic education
- AU Education Observatory

Among international surveys, Multiple Indicator Cluster Surveys (MICS) and Demographic and Health Surveys (DHS) and sometimes also Living Standards Measurement Studies and Core Welfare Indicators Questionnaire Surveys in Africa provide school attendance data.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

- Lack of accurate data is a major problem when operationalizing the indicator.
- Population figures are estimated and enrolment data is subject to tabulation errors and missing data.
- Inaccurate population estimates and less than 100% returns of school questionnaires make enrolment rates unreliable.
- Inadequate data collection applications
- Perverse incentives in data reporting

**Actions Taken or Planned to Address Data Limitations:**

- Development of data collection software
- Training of Member States
- Strengthening of national and continental EMIS ecosystems

**Indicator 14: Proportion of teachers qualified in Science, Technology, Engineering or Mathematics****Indicator Reference: A1 – G2 – P1 - T3 – I14****DESCRIPTION****Definition**

The proportion of teachers qualified in Science, Technology, Engineering or Mathematics (STEM) is defined as the percentage of teachers qualified according to national standards by education level and type of institution.

**Clarification**

Common standards will need to be agreed that can be applied to both public and private institutions. Qualified teachers have at least the minimum academic qualifications required by national standards for teaching STEM. STEM refers to the fields of study of science, technology, engineering, and mathematics. It is typically used in addressing education policy and curriculum choices in schools from kindergarten through college to improve competitiveness in technology development, which in turn has a great influence on a country's social and economic development.

It is also the share of qualified teachers who have received organized teacher training (pre-service or in-service) required for teaching STEM in a given country. Number of teachers who have received the minimum academic qualifications required for teaching STEM at a particular level of education in the given country, expressed as a percentage of the total number of teachers at the same level of education.

This indicator measures the share of the teaching work force, which is pedagogically well trained in STEM. An increase in the value of this indicator suggests that more teachers have received the pedagogical training necessary to teach. It is also an indication of inputs towards building a scientific culture necessary for 21<sup>st</sup> century competences for employment, critical thinking and innovation, all required for social economic development

**Computation Formula**

The formula for computing this indicator is as follows:

Divide the number of teachers in STEM at a specified level of education who have received the minimum academic qualifications required for teaching STEM by the total number of teachers at the same level of education, and multiply the result by 100.

$$\%T_{h,c} = (T_{h,c} / T_h) \times 100$$

Where:

$\%T_{h,c}$  is the percentage of teachers of level of education h who have the required qualifications in STEM in year t

$T_{h,c}$  is the total number of teachers of level of education h who have the required qualifications in STEM in year t

$T_h$  is the total number of teachers of level of education h in a given year t

**Unit of measurement:**

Percentage

**Disaggregated by:**

- Level (primary or secondary level)
- Sex (Male, female)
- By specific subject (e.g. Mathematics, Engineering, Biology....)
- Geographic location (region, urban/rural)
- Type of institution (public/private)

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Data will be extracted from Ministry of Education's reports and surveys.
- Periodic surveys on secondary education

**Data Sources:**

- Ministry of Education
- School census and surveys
- School registers
- Teacher records
- AU Education Observatory
- UNESCO: <http://data.uis.unesco.org>

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):

This indicator does not take into account differences in teachers' experiences and status, teaching methods, teaching materials and variations in classroom environment-- all factors that also affect the quality of teaching/learning. It should be noted that some teachers without these academic qualifications may have acquired equivalent pedagogical skills through professional experience.

**Actions Taken or Planned to Address Data Limitations:**

- Development of Teacher Qualification Frameworks to facilitate classification
- Development of data collection tools

**Indicator 15: Secondary school net enrolment rate.****Indicator Reference: A1 – G2 – P1 - T4 – I15****DESCRIPTION****Definition:**

Secondary school net enrolment rate is defined as the total number of students in the official age group for secondary education enrolled in that level, expressed as a percentage of the total population in that age group.

**Clarification**

Net Enrolment Rate (NER) at each level of education should be based on enrolment of the relevant age group in all types of schools and education institutions, including public, private and all other institutions that provide organized educational programmes.

Net Enrolment Rate is considered to be a measure of the education coverage in a specific level of a country's education system.

Secondary education is the second stage found in formal education, beginning about age 11 to 13 and ending usually at age 15 to 18.

The Continental Education Strategy for Africa (CESA 2016 -2025) calls for compulsory completion of secondary education.

Policy makers use the indicator to track the extent to which progress towards the attainment of targets on secondary education in national development plans are being attained; the insights are used to re-design policy interventions

**Computation**

$$\text{Secondary school net enrolment rate} = \frac{\text{Number of students enrolled who are of the official age group for secondary education}}{\text{Population eligible for secondary education}} \times 100$$

**Unit of measurement:** Percentage**Disaggregated by:**

- Sex (Male, female)
- Age
- Geographic location (rural / urban)

**PLAN FOR DATA ACQUISITION****Data Collection method:**

The NER will be extracted from the Ministry's Educational Management Information System and annual statistical reports.

**Data Source:**

- Ministry's Educational Management Information System annual statistical reports
- Among international surveys, Multiple Indicator Cluster Surveys (MICS) and Demographic and Health Surveys (DHS) and sometimes also Living Standards Measurement Studies (<http://econ.worldbank.org/WBSITE/EXTERNAL/EXTDEC/EXTRESEARCH/EXTLSMS/0,contentMDK:21610833~pagePK:64168427~piPK:64168435~theSitePK:3358997,00.html>) and Core Welfare Indicators Questionnaire Surveys in Africa (<http://ghdx.healthdata.org/series/core-welfare-indicators-questionnaire-survey-cwig>) provide school attendance data.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

## DATA QUALITY ISSUES

### **Known Data Limitations and Significance** (if any):

- Lack of accurate data is a major problem when operationalizing the indicator.
- Population figures are estimated and secondary school net enrolment data is subject to tabulation errors and missing data.
- Inaccurate population estimates and less than 100% returns of secondary school questionnaires make enrolment rates unreliable.
- Inadequate data collection applications
- Perverse incentives in data reporting

### **Actions Taken or Planned to Address Data Limitations:**

Definition of secondary education and attendant age ranges

### Goal 3: Healthy and Well-Nourished Citizens

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Health and Nutrition	1. Increase 2013 levels of access to sexual and reproductive health services to women by at least 30%	% of women in the reproductive age 15-49 who have access to sexual and reproductive health services in the last 12 months	3.7.1
	2. Reduce 2013 maternal, neo-natal and child mortality rates by at least 50%	a) Maternal mortality ratio	3.1.1
		b) Neo-natal mortality rate	3.2.2
		c) Under five mortality rate	3.2.1
		d) % of deliveries attended by skilled health personnel.	3.1.2
	3. Reduce the 2013 incidence of HIV/AIDs, Malaria and TB by at least 80%	a) Number of new HIV infections per 1000 population	3.3.1
		b) TB incidence per 1000 persons per year	3.3.2
		c) Malaria incidence per 1000 per year	3.3.3
	4. Access to Anti-Retroviral (ARV) drugs is 100%	% of eligible population with HIV having access to ARV	
	5. Reduce stunting in children to 10% and underweight to 5%.	Prevalence of underweight among children under 5	2.2.1

**Indicator 16:** Percentage of women in the reproductive age 15-49 who have had access to sexual and reproductive health services in the last 12 months

**Indicator Reference:** A1 – G3 – P1 – T1– I16

**DESCRIPTION**

**Definition:**

This is the percentage number of women in the reproductive age who have access to sexual and reproductive health services in the last 12 months as a proportion of the total number of women in the reproductive age

**Clarification**

Women in reproductive age refers to women who are in the age group 15 to 49.

Health services of particular interest include those concerned with:

- HIV counselling, testing, treatment;
- diagnosis and treatment of sexually transmitted infections (STIs);
- counselling, provision, and referrals for contraceptives.

Other sexual and reproductive health (SRH) service includes:

- prenatal care,
- abortion or post abortion care,
- micronutrient supplementation,
- counselling and treatment for victims of rape or sexual assault,
- treatment of obstetric fistula.

**Computation Formula**

At the **population level** this indicator is calculated as follows:

$$\begin{array}{l} \text{\% of women in the reproductive} \\ \text{age who have access to sexual} \\ \text{and reproductive health service} \end{array} = \frac{\text{No. of women aged 15-49 who report} \\ \text{receiving any SRH services in the last 12 months}}{\text{Total No. of women aged 15-49 surveyed}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Age bracket (15-19; 20-24; 25-29; 30-34; 35-39; 40-44; 45-49)
- Level of education (none, primary, secondary, tertiary, others)
- Marital status (married/cohabiting, single(never married), divorced/widowed/separated)
- Urban, rural location
- Type of facility

**PLAN FOR DATA ACQUISITION**

**Data Collection method:**

Population-based data requires the number of women of reproductive age (15-49) reporting use of specified SRH services in the past year and the number of women of reproductive age (15-49)

**Data Source:**

- DHS or other nationally representative general population survey
- Population-based methods such as surveys that give an estimate of the coverage of health services
- Facility-based records (measuring service utilization only)
- Reputable NGOs

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

The correct interpretation of the data collected requires some population-based estimates to understand the magnitude of need in order to interpret increases or decreases in specific services used.

An increase in the number of young people seeking services does not necessarily mean an increase in the proportion of young people with SRH needs or issues. The increase may well be attributable to other factors, such as an information campaign advertising the services or a health promotion program.

A challenge with tracking this indicator is that it depends on facilities having well-maintained and accurate records and logbooks, including age-specific records or at least records in age brackets allowing for disaggregation of young people from adults.

Moreover, the measurement of service utilization provides no information about the quality of services. In order to obtain a better understanding of the trends observed in utilization, these data should be complemented by measuring the quality and effectiveness of SRH services with additional indicators.

**Actions Taken or Planned to Address Data Limitations:**

- Use of additional indicator to assess the quality and effectiveness of SRH services.
- Use of population-based estimates.

**Indicator 17: Maternal mortality ratio****Indicator Reference: A1 – G3 – P1 – T2– I17****DESCRIPTION****Definition:**

The maternal mortality ratio (MMR) is the annual number of maternal deaths per 100,000 live births, for a specified year. The maternal mortality is the annual number of maternal deaths from any cause related to or aggravated by pregnancy or its management (excluding accidental or incidental causes) during pregnancy and childbirth or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy.

**Clarification**

Maternal mortality can be divided into two groups, namely direct and indirect obstetric deaths. Direct obstetric deaths result from obstetric complications of the pregnant state (pregnancy, labour and puerperium); from interventions, omissions or direct treatment; or from a chain of events resulting from any of these. Indirect deaths result from previously existing diseases, or diseases that developed during pregnancy, which were not directly due to obstetric causes, but were aggravated by the physiological effects of pregnancy.

A live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life—such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles—whether or not the umbilical cord has been cut or the placenta is attached. Each product of such a birth is considered a live birth.

This indicator monitors deaths related to pregnancy and childbirth. It reflects the capacity of health systems to provide effective health care in preventing and addressing the complications occurring during pregnancy and childbirth.

Estimating maternal mortality, in particular when there are problems with data quality, results in wide ranges of uncertainty bracketing the produced estimates.

**Computation:**

The maternal mortality ratio is calculated by dividing recorded (or estimated) maternal deaths by total recorded (or estimated) live births in the same period and multiplying by 100,000. The measurement requires information on pregnancy status, timing of death (during pregnancy, during childbirth, or within 42 days of termination of pregnancy), and cause of death.

$$\text{Maternal Mortality Ratio} = \frac{\text{Number of Maternal Deaths}}{\text{Number of Live Births}} \times 100,000$$

**Special Considerations:**

It is advisable to interpret the maternal mortality ratio within the context of other reproductive health-related information including presence of skilled health personnel at delivery, antenatal care, and levels of fertility.

**Disaggregated by:**

- Urban, Rural,
- Age of the mother,
- Education
- Direct / indirect obstetric deaths
- Private / public hospitals

**PLAN FOR DATA ACQUISITION**

**Data Collection method:**

- DHS Survey
- Census
- NHMIS

Because maternal mortality is a relatively rare event, large sample sizes are needed when data are derived from household surveys. This is very costly and may still result in estimates with large confidence intervals.

The sisterhood method, used in DHS surveys, reduces sample size requirements by asking survey respondents about the survivorship of sisters. Respondents are asked four simple questions about how many of their sisters reached adulthood, how many have died and whether those who died were pregnant at the time of death. While this method reduces sample size requirements, it produces estimates covering some 7-12 years before the survey, which renders data problematic for monitoring progress or observing the impact of interventions. The direct sisterhood method asks respondents to provide date of death, which permits the calculation of more recent estimates, but even then the reference period tends to refer to 0-6 years before the survey.

**Data Source:**

Primary sources of data include vital registration systems, household surveys, reproductive age mortality studies, disease surveillance or sample registration systems, special studies on maternal mortality, and national population censuses. Complete vital statistics registration systems with accurate cause of death estimations are the most reliable data source for calculating maternal mortality and monitoring change over time. However, these are rare in developing countries. Official data are usually available from health service records, but few women in rural areas have access to health services. Therefore in developing countries, survey data, especially those from the Demographic and Health Surveys (DHS) and similar household surveys constitute the most common source of data on maternal mortality.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

Maternal mortality is difficult to measure. Vital registration and health information systems in most developing countries are weak, and thus, cannot provide accurate assessments of maternal mortality. Even figures derived from complete vital registration systems, such as those in developed countries, suffer from misclassification and underreporting of maternal deaths.

It is also expensive to collect the data.

**Actions Taken or Planned to Address Data Limitations:**

Due to very large confidence intervals, maternal mortality estimates might not be suitable for assessing trends over time. As a result, it is recommended that country level process indicators, such as attendance by skilled health personnel at delivery and use of health facilities for delivery, be used to supplement maternal mortality ratios for assessing progress towards the reduction in maternal mortality at the country level.

**Indicator 18: Neonatal mortality rate (per 1,000 live births)****Indicator Reference: A1 – G3 – P1 – T2– I18**

DESCRIPTION: Deaths of infants within the first 28 days of life

**Definition:**

Neonatal mortality rate is the probability that a child born in a specific year or period will die during the first 28 completed days of life if subjected to age-specific mortality rates of that period, expressed per 1000 live births.

**WHO definition:**

Number of deaths that occur during the first 28 completed days\* of life per 1 000 live births in a given year or period.

(source: <https://www.who.int/whosis/whostat2006NeonatalMortalityRate.pdf>)

**Clarification**

Neonatal deaths (deaths among live births during the first 28 completed days of life) may be subdivided into early neonatal deaths, occurring during the first 7 days of life, and late neonatal deaths, occurring after the 7th day but before the 28th completed day of life.

Mortality during the neonatal period accounts for a large proportion of child deaths, and is considered to be a useful indicator of maternal and new born neonatal health and care. This indicator monitors the quality of care for the neonate.

**Computation:**

$$\text{Neonatal mortality rate} = \frac{\text{No. of children who died during the first 28 days of life}}{\text{Number of live births (years of exposure)}} \times 1000$$

**Disaggregated by:**

- Age in days/weeks
- Birth weight
- Place of residence
- Facility Vs Home
- Sex (Male, Female)
- Age of mother

**PLAN FOR DATA ACQUISITION****Data Collection method:**

Surveys to generate data from civil registration: The number of live births and the number of neonatal deaths are used to calculate age-specific rates. This system provides annual data.

Household surveys: Calculations are based on full birth history; women are asked for the date of birth of each of their children, whether each child is still alive and if not the age at death.

The United Nation Inter-agency Group for Child Mortality Estimation (UN-IGME) produces neonatal mortality rate estimates with a Bayesian spline regression model which models the ratio of neonatal mortality rate / (under-five mortality rate - neonatal mortality rate). Estimates of NMR are obtained by recombining the estimates of the ratio with UN IGME-estimated under-five mortality rate.

**Data Source:**

- Civil registration records with high coverage / Ministry of Health
- Other possible sources: Household surveys, population census
- World Health Organization and UN-IMGE United Nation Inter-agency Group for Child Mortality Estimation:  
[http://www.who.int/maternal\\_child\\_adolescent/documents/levels\\_trends\\_child\\_mortality\\_2015/en/](http://www.who.int/maternal_child_adolescent/documents/levels_trends_child_mortality_2015/en/)

**Frequency and Timing of Data Collection, Analysis and Reporting:**

Annual if based on registration system. Otherwise, less frequent (3-5 years based on surveys)

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 19: Under five mortality rate****Indicator Reference: A1 – G3 – P1 – T2– I19****DESCRIPTION****Definition:**

The under five-mortality rate (U5MR) is the probability for a child born in a specified year to die before reaching the age of five, if subject to current age specific mortality rates. This indicator is expressed as number of deaths per 1,000 live births.

**Clarification**

Under-5 mortality rate is a leading indicator of the level of child health/survival and overall development in countries. It also reflects the social, economic and environmental conditions in which children (and others in society) live, including the quality of health care. Data on disease incidence and prevalence (morbidity data) are frequently unavailable, so mortality rates are often used to identify vulnerable populations.

This indicator helps in identifying populations in high-mortality settings in an environment where morbidity data are lacking.

**Computation Formula:**

The indicator is calculated as equal to the number of deaths of children under five in a calendar year divided by the number of live births in the same year and multiplied by 1,000. The formula for computing this indicator is as follows:

$$U5MR(n) = \frac{D(0 - 59, n)}{B(n)} \times 1,000$$

where U5MR(n) is the under-five mortality rate for the calendar year n; D (0-59, n) is the number of children aged 0 to 59 months during year n and who died during year n; and B (n) is the number of live births occurring during year n.

**Disaggregated by:**

- Sex: Male, Female
- Age of mother
- Urban, Rural
- Region/Province/states
- Number of siblings
- Wealth quantile
- Mothers education status

Under-five mortality generally shows large disparities across geographical areas and between rural and urban areas. Under-five mortality may also vary across socioeconomic groups. Children in some ethnic groups might be at higher risk of malnutrition, poorer health and higher mortality. Gender differences may be more pronounced in some social and ethnic groups and in rural areas. Disaggregating the data will provide a clearer picture of child health disparities, allowing programs to address these weaknesses and gaps.

**PLAN FOR DATA ACQUISITION****Data Collection method:**

The best source of data for computing direct estimates of U5MRs is a complete vital statistics registration system—one covering at least 90 per cent of vital events in the population. However, few developing countries have well-functioning civil registration systems. Alternatively, household surveys that collect complete birth histories (such as the DHS) can be used to get direct estimates of U5MRs.

If no source of direct estimates is available, population censuses, household surveys that collect incomplete birth histories (such as the MICS), and general surveys can be used to derive indirect estimates of U5MRs.

**Data Source:**

Possible sources of data include vital registration systems, national population censuses, household surveys conducted by global programmes, and multi-purpose surveys conducted without international sponsorship.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

Data on under-five mortality are more complete and timely than data on adult mortality. Under-five mortality rates are also considered to be more robust than infant mortality rates when estimates are based on information drawn from household surveys.

Vital registration systems are the preferred source of data on under-five mortality because data are prospective and cover the entire population. However, in countries lacking a fully functioning vital registration system, household surveys, such as DHS and MICS, have become the primary source of data on child mortality, even though there are some limits to their quality.

Survey data are subject to recall error. Interviewed women may omit births and deaths, or include stillbirths along with live births. Survey data may also suffer from survivor selection bias and age truncation. Mothers may misreport their children's birth dates, current ages or ages at death—perhaps more so if the child has died. The heaping of deaths at age 12 months is especially common. Age heaping may transfer deaths across the one-year boundary and lead to underestimates of infant mortality rates. Fortunately, it has little effect on under-five mortality rates, which makes the U5MR a more robust estimate than the infant mortality rate when data are drawn from household surveys.

There are also gender-based biases in the reporting of child deaths. Moreover, survey frequency is generally only every three to five years.

Another limitation is that indirect estimates rely on model actuarial (“life”) tables that may be inappropriate for the population concerned. Indirect estimates obtained from household surveys have attached confidence intervals that need to be considered when comparing values over time or across countries. Similarly, these estimates are often affected by non-sampling errors that may affect recent levels and trends of U5MRs. Recall error and social disorientation are some factors contributing to data limitations.

**Actions Taken or Planned to Address Data Limitations:**

The United Nations Children's Fund (UNICEF), the World Health Organization (WHO), and the United Nations Population Division (UNPD) produce country estimates based on available national data for purposes of international comparisons and assessment of global and regional trends. Data series produced by the different agencies may differ owing to differences in methodologies used to estimate data and differences in reporting periods.

Current estimates of U5MR are generally based on empirical data from several or even many years before. Vital registration data are available on a yearly basis but are often published at the country level with a lag of 2 or more years. Population censuses are conducted every ten years and results are published one to three years after the census. Household surveys, such as DHS and MICS, are in general implemented every three to five years with results published within a year of field data collection. On average, the most recent U5MR estimates from household surveys refer to 2.5 years before the time of the survey or 3.5 years before the time of publication of findings.

Different data sources and calculation methods often yield widely different estimates of child mortality for a given time and place. In order to reconcile these differences, UNICEF developed, in coordination with WHO, the World Bank and UNDP, an estimation methodology that minimizes the errors embodied in each estimate and maximizes the consistency of trends over time. These estimates are not necessarily recognized as the official U5MR country level estimates. However they allow comparisons to be made between countries, despite the varied numbers and types of country level data sources.

To seek out national data sources that might be overlooked, UNICEF conducts an annual exercise called the Country Reports on Indicators for the Goals (CRING). CRING gathers recent information for all indicators regularly reported by UNICEF, including the infant and under-five mortality rates.

After plotting all available values for infant and under-five mortality, analysts use weighted least squares models to fit a multi-spline regression line to the data points and extrapolate the trend to the present. The use of weights allows analysts to judge the relative quality of each data set and determine how representative each set is of the population. Analysts then decide which sets of estimates (infant mortality rates or under-five mortality rates) are more consistent and use a model life table to derive the other set of estimates from it.

Global figures produced by the inter-agency group for child mortality estimation may differ from those produced at the country level for different reasons. Global estimates use all available data obtained from different sources (vital registration, census, and household surveys) to produce estimates that represent trends and levels of child mortality in the countries. On the other hand, country estimates are obtained from just one source (normally household surveys such as the DHS), a combination of data sources, or from using different estimation methods.

Inter-agency group estimates are updated annually. U5MR estimates are produced and presented at the regional and global levels only if data are available for at least 50 per cent of the region or the total population of the countries considered

**Indicator 20: Percentage of deliveries attended to by skilled health personnel.**

**Indicator Reference: A1 – G3 – P1 – T2 – I20**

**DESCRIPTION**

**Definition:**

Percentage of births attended by skilled health personnel (generally doctors, nurses or midwives) is the percentage of deliveries attended by health personnel trained in providing lifesaving obstetric care, including giving the necessary supervision, care and advice to women during pregnancy, labour and the post-partum period, conducting deliveries on their own, and caring for newborns.

**Clarification**

A live birth is the complete expulsion or extraction, from its mother, of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life—such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles—whether or not the umbilical cord has been cut or the placenta is attached. Each product of such a birth is considered a live birth.

A skilled birth attendant is an accredited health professional—such as a midwife, doctor or nurse—who has been educated and trained to proficiency in the skills needed to manage normal (uncomplicated) pregnancies, childbirth and the immediate postnatal period; and in the identification, management and referral of complications in women and new-borns.

Traditional birth attendants are traditional, independent (of the health system), non-formally trained and community-based providers of care during pregnancy, childbirth and the postnatal. Traditional birth attendants, whether trained or not, are excluded from the category of skilled health workers.

Measuring maternal mortality accurately is difficult, except where there is comprehensive registration of deaths and causes of death. Several process indicators have been proposed for tracking progress toward improving maternal health, such as attendance of professional care during pregnancy and childbirth, which is particularly important for the management of complications. Assistance by properly trained health personnel is key to lowering maternal deaths. The proportion of women who give birth with the assistance of a medically trained health care provider is one of the most widely used of these process indicators.

Indicator values are close to 100 where skilled birth assistance is provided to all women, as is the case in most of the developed regions. Values of less than 20 per cent are found in settings where health care is very poor and maternal mortality is a major public health problem. The proportion of births attended by skilled health personnel should be closely followed together with a set of related indicators disaggregated by socio-economic characteristics to identify target populations and plan policy measures accordingly.

This indicator provides clues to policy makers of the extent to which efforts geared at improving the supply side of health services are being attained.

**Computation Formula**

The indicator is calculated as the number of births attended by skilled health personnel (doctors, nurses or midwives) divided by the total number of births in the same period and multiplied by 100.

*Percentage of deliveries attended to by skilled health personnel*

$$= \frac{\text{number of births attended by skilled health personnel}}{\text{Total number of births}} \times 100$$

**Disaggregated by:**

- Rural, Urban areas
- Age of mother

- Levels of social and economic status

## PLAN FOR DATA ACQUISITION

### Data Collection methods:

In order to facilitate interpretation of trends and differentials based on survey data, it is useful to report confidence intervals together with estimates.

In the absence of survey data, some countries may have health facility data. However, it should be noted that these data might overestimate the proportion of deliveries attended by a skilled professional because the denominator presumably excludes women who give birth outside of health facilities.

### Data Source:

Data are collected through national-level household surveys, including Multiple Indicator Cluster Surveys (MICS) and Demographic Health Surveys (DHS). These surveys are generally conducted every 3–5 years by national statistical offices or ministries of health.

### Frequency and Timing of Data Collection, Analysis and Reporting:

- Annual

## DATA QUALITY ISSUES

### Known Data Limitations and Significance (if any):

This indicator is a measure of a health system's ability to provide adequate care during birth, a period of elevated mortality risk for both mothers and newborns. However, this indicator may not adequately capture information on women's access to good quality care, particularly when complications arise. In order to effectively reduce maternal deaths skilled health personnel should have the necessary equipment and adequate referral options.

In addition, standardization of the definition of skilled health personnel is sometimes difficult because of differences in training of health personnel in different countries. Although efforts have been made to standardize the definitions of doctors, nurses, midwives and auxiliary midwives used in most household surveys, it is probable that many skilled attendants' abilities to provide appropriate care in an emergency depends on the environment in which they work.

Recall error is another potential source of bias in the data. In household surveys, the respondent is asked to recall each live birth for a period of up to five years before the interview. The respondent may or may not know or remember the qualifications of the attendants at delivery during the reference period.

Facility data (if used) would exclude women who give birth at home and thus would overestimate the true proportion of deliveries with a skilled attendant.

### Actions Taken or Planned to Address Data Limitations:

**Indicator 21: Number of new HIV infections per 1000 population****Indicator Reference: A1 – G3 – P1 – T3 – I21****DESCRIPTION****Definition:**

This is the incidence of new HIV infections per 1000 uninfected population.

**Clarification**

The incidence rate is the number of new cases per population at risk in a given time period.

Uninfected population is the total population excluding the people living with HIV.

This indicator provides clues to policy makers as to the level/magnitude of interventions required to attain set national targets on HIV prevalence.

**Computation Formula**

$$\text{Number of new HIV infections} = \frac{\text{Total new HIV cases over a specified period (annually)} * 1000}{(\text{Total pop}^n \text{ of uninfected people} + \text{total new HIV cases})^{**}}$$

*\*\* (This is also interpreted as the uninfected population during the specified period)*

**Disaggregated by:**

- General population,
- Key populations (MSM, sex workers, IDU, truck drivers, fishermen)
- Sex and age groups (0-14, 15-24, 25-49); Child <3 years, < 1 year (to capture mother-to-child infections)
- Place of residence

**PLAN FOR DATA ACQUISITION****Data Collection method:**

Longitudinal data on individuals are the best source of data but are rarely available for large populations. Special diagnostic tests in surveys or from health facilities can be used to obtain data on HIV incidence.

In generalized epidemics, prevalence among very young age groups can be reviewed as a proxy for or a data source for triangulating incidence.

HIV incidence can also be modelled (e.g. using the Spectrum software). Modelling is often used to obtain an estimate of new infections. Prevalence data are the main input data.

**Data Source:**

- Household or key population survey with HIV incidence testing, Spectrum modelling.
- Other possible data sources: Regular surveillance system among key populations

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual
- Survey schedule; Spectrum model estimates updated every year

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):****Actions Taken or Planned to Address Data Limitations:**

**Indicator 22: Tuberculosis (TB) incidence per 1,000****Indicator Reference: A1 – G3 – P1 – T3 – I22****DESCRIPTION****Definition:**

Incidence of tuberculosis is the estimated number of new and relapse tuberculosis cases arising in a given year, expressed as the rate per 1,000 population.

**Clarification**

All forms of TB (pulmonary and extra pulmonary) are included, including cases of people living with HIV.

**Computation Formula**

$$\text{TB incidence per 1,000} = \frac{\text{No. of new and relapse TB cases arising in a specified time period}}{\text{No. of person-years of exposure}} \times 1000$$

**Disaggregated by:**

- Age, Sex (Male, female), HIV status

**PLAN FOR DATA ACQUISITION****Data Collection method:**

Direct measurement requires high-quality surveillance systems in which underreporting is negligible, and strong health systems so that under diagnosis is also negligible. The alternative is indirect estimates based on notification data and estimates of levels of underreporting and under-diagnosis.

Estimates of TB incidence are produced through a consultative and analytical process led by WHO and are published annually. These estimates are based on annual case notifications, assessments of the quality and coverage of TB notification data, national surveys of the prevalence of TB disease and information from death (vital) registration systems.

Estimates of incidence for each country are derived, using one or more of the following approaches depending on available data:

Incidence = case notifications / estimated proportion of cases detected;

Incidence = prevalence/duration of condition;

Incidence = deaths/proportion of incident cases that die.

Uncertainty bounds are provided in addition to best estimates.

**Data Source:**

- High quality TB surveillance system (linked to routine facility information system)
- Other possible data sources: Population-based health surveys with TB diagnostic testing
- World Health Organization, Global Health Observatory data. – : <https://www.who.int/gho/countes/en/>.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):****Actions Taken or Planned to Address Data Limitations:**

**Indicator 23: Malaria incidence per 1000 persons per year****Indicator Reference: A1 – G3 – P1 – T3 – I23****DESCRIPTION****Definition:**

Number of newly diagnosed malaria cases during a defined period in a specified population, confirmed by microscopic or rapid diagnostics test.

**Clarification**

Number of suspected malaria cases confirmed by either microscopy or rapid diagnostic test.

**Computation Formula**

$$\text{Malaria incidence per 1000} = \frac{\text{No. of confirmed malaria cases}}{\text{No. of person-years of exposure}} \times 1000$$

**Disaggregated by:**

- Age
- Place of residence (high & low risk)
- Season (year and month)

**PLAN FOR DATA ACQUISITION****Data Collection method:**

Microscopy: The number of cases confirmed by microscopy, including both inpatients and outpatients of all ages. Also includes cases detected by both active and passive case detection, but excludes cases detected in the community.

Rapid diagnostic tests: The number of cases confirmed by rapid diagnostic tests, including both inpatients and outpatients of all ages. Also includes cases detected by both active and passive case detection, but excludes cases that are also confirmed by microscopy or that are detected and confirmed by community-based programmes.

WHO compiles data on reported confirmed cases of malaria, submitted by the national malaria control programmes. The denominator is estimated, using risk mapping and population data.

**Data Source:**

- Surveillance systems
- Consistent estimates based on survey and health facility
- World Health Organization database: <http://www.who.int/nutgrowthdb/database/en/>

**Frequency and Timing of Data Collection, Analysis and Reporting:**

Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):****Actions Taken or Planned to Address Data Limitations:**

**Indicator 24: Percentage of eligible population with HIV having access to Anti-Retroviral Treatment****Indicator Reference: A1 – G4 – P1 - T4 – I24****DESCRIPTION****Definition:**

This is the percentage of eligible people living with HIV who have access to ARV treatment among the estimated number of adults and children living with HIV.

**Clarification**

WHO guidelines on ARV eligibility have evolved both for adults and children over the years. Given the varied application of guidelines and standards on eligibility across the continent, ARV eligibility is disaggregated into three categories namely; universal, less than 350 cells/mm<sup>3</sup> and CD4 count between 350 – 500 cells / mm<sup>3</sup>.

Standard antiretroviral therapy (ART) consists of the combination of antiretroviral (ARV) drugs to maximally suppress the HIV virus and stop the progression of HIV disease. ART also prevents onward transmission of HIV.

Population coverage indicators generally depict national program results and describe coverage of a specific service (i.e. ARV treatment) among a population eligible for the service (i.e. number of adults and children living with HIV).

This indicator assists policy makers to measure efforts towards reductions in HIV related deaths / design appropriate policy interventions.

**Computation Formula**

$$\% \text{ of eligible population with HIV having access to ARV treatment} = \frac{\text{No. of people living with HIV who have access to Anti-Retroviral Treatment at the end of the reporting period}}{\text{Estimated total number of people living with HIV}} \times 100$$

**Disaggregated by:**

- Age: below or above 19 years old
- Percentage of population with HIV CD4 count less than 350 cells / mm<sup>3</sup>, CD4 count between 350 – 500 cells / mm<sup>3</sup> and universal access.
- Minimum for paper-based (routine): <15, 15+;
- Annual data extraction of disaggregated data if not reported routinely: <5, 5–9, 10–14, 15–19, 20–24, 25–49, 50+;
- Electronic system: 5-year age groups
- Key populations, provider of treatment type (public/private), regimen type (e.g. first line, second line), sex (Male, Female)

**PLAN FOR DATA ACQUISITION****Data Collection method:**

**Numerator:** The numerator can be generated by counting the number of adults and children who had access to antiretroviral combination therapy at the end of the reporting period. Data can be collected from facility-based ART registers or drug supply management systems. These are then tallied and transferred to cross-sectional monthly or quarterly reports, which can then be aggregated for national totals. Patients having access to ARV treatment in the private sector and public sector should be included in the numerator where data are available.

**Denominator:** The denominator is generated by estimating the number of people with advanced HIV infection requiring (in need of/eligible for) ARV treatment. This estimation must take into consideration a variety of factors, including, but not limited to, the current number of people with HIV, the current number of patients on ART and the

natural history of HIV from infection to enrolment on ART. A standard modelling HIV estimation method, such as in the Spectrum model, is recommended.

**Data Source:**

- Facility reporting system
- Ministry of Health
- National Statistics Office

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance** (if any):

Providing “access” does not necessarily guarantee that adults and children living with HIV “use” ARV treatment and thus potential health benefits are not certain to be realized from simply providing “access.”

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 25: Prevalence of underweight among children under 5****Indicator Reference: A1 – G1 – P1 – T5 – I25****DESCRIPTION****Definition:**

The prevalence of underweight children under five years of age is defined as the percentage of children aged 0–59 months, whose weights are less than two standard deviations below the median weight for age groups in the international reference population.

**Clarification**

Underweight is a weight-for-age measurement. Underweight is a reflection of acute and/or chronic under nutrition. Although different levels of severity of underweight can be measured, this indicator measures the prevalence of all-underweight, i.e. both moderate and severe underweight combined.

The international reference population is a population against which the growth of children can be compared. The reference population is defined by the World Health Organization (WHO) Child Growth Standards. The standards are based on more than 8,000 children from Brazil, Ghana, India, Norway, Oman and the United States of America. These children were selected based on their exposure to an optimal environment for proper growth including recommended infant and young child feeding practices, good healthcare, non-smoking mothers, and other factors associated with good health outcomes.

**Computation Formula**

The number of underweight children is the number of children under five years of age whose weights are less than two standard deviations below the median weight for each age in the international reference population.

The weights of children under five years of age are compared with the weights given in the standard reference population for each age group. The percentage of children underweight is the aggregate of the number of children underweight divided by the number of children weighed multiplied by 100.

$$\text{Percentage of children underweight} = \frac{\text{Number of children underweight}}{\text{Total number of children who were weighed}} \times 100$$

Under-five underweight prevalence is an internationally recognized public health indicator for monitoring nutritional status and health in populations. Child nutritional status is monitored more closely than adult nutritional status.

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Sex: Male, Female
- Rural / urban

Indicators of malnutrition generally show differences between rural and urban locations and among socioeconomic groups. In some countries, child nutrition may vary across geographical areas, and/or ethnic groups. Gender differences may also be more pronounced in some social and ethnic groups than in others.

## PLAN FOR DATA ACQUISITION

### **Data Collection method:**

Data are drawn from one of two sources: 1) the DHS, if the data were collected within the previous two years and a large enough sample was collected from clusters within the targeted areas; or 2) primary data collected via a population-based survey conducted in the targeted areas by an M&E contractor, using the official DHS method of collection.

At the national level, data are generally collected from national household surveys, including Demographic and Health Surveys (DHS), Multiple Indicator Cluster Surveys (MICS) and national nutrition surveys. It should be noted that when comparing estimates within a country over time or across countries, these estimates should be based on the same reference population.

DHS and MICS are generally conducted every three-to-five years. Some countries conduct national nutrition surveys annually.

### **Data Source:**

- Population-based survey, national household surveys and official DHS data

### **Frequency and Timing of Data Collection, Analysis and Reporting:**

Data should be collected in the targeted areas for baseline, mid-term, and final reporting. DHS data are collected every five years. Information on the frequency of DHS by country can be obtained at:

[http://www.measuredhs.com/aboutsurveys/search/metadata.cfm?surv\\_id=228&ctry\\_id=33&SrvyTp=country](http://www.measuredhs.com/aboutsurveys/search/metadata.cfm?surv_id=228&ctry_id=33&SrvyTp=country)

## DATA QUALITY ISSUES

### **Known Data Limitations and Significance (if any):**

There are some problems with data collection and compilation that may affect the reliability of nutritional status indicators, such as:

The underweight indicator reflects body mass relative to chronological age and is influenced both by the height of the child, and weight-for-height. Its composite nature complicates its interpretation. For example, the indicator fails to distinguish between short children of adequate body weight and tall, thin children.

The accuracy of nutritional status indicators depends on proper measurements in age, weight, and height. For example, only those children with month and year of birth recorded and with valid height and weight measurements are included in the calculations.

In April 2006, the WHO released the WHO Child Growth Standards to replace the widely used National Center for Health Statistics (NCHS)/WHO reference population. Studies have shown important differences between these two reference populations, especially during infancy. Therefore, to allow for comparability over time, the anthropometric indicators will have to be analysed using both the NCHS/WHO and the new WHO Child Growth Standards

**Actions Taken or Planned to Address Data Limitations:**

While underweight prevalence is a useful indicator to assess overall nutritional status of the population, stunting and wasting prevalence are also useful indicators for tracking trends in child malnutrition.

Stunting, also known as low height-for-age, measures levels of cumulative deficient growth associated with long-term factors, including chronic insufficient daily protein intake. This indicator is defined as the percentage of children under five whose heights are less than two standard deviations below the median height for the age of the standard reference population.

Wasting, also known as low weight-for-height, indicates in most cases a recent and severe process of weight loss, often associated with acute starvation or severe disease. This indicator is defined as the percentage of children under five whose weights are less than two standard deviations below the median weight for height of the reference population.

When possible, all three indicators (underweight, stunting, and wasting) should be analysed and presented since they measure and reflect different aspects of child nutrition.

## Goal 4: Transformed Economies and Job Creation

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Sustainable inclusive economic growth	1. Annual GDP growth rate of at least 7%	GDP Growth Rate	8.1.1
2. STI driven Manufacturing / Industrialization and Value Addition	2. Gross Domestic Expenditures on R&D as a percentage of GDP has reached 1% by 2023	R&D expenditure as a proportion of GDP	9.2.1
3. Economic diversification and resilience	3. Real value of manufacturing in GDP is 50% more than the 2013 level.	Manufacturing value added as % of GDP	
4. Hospitality / Tourism	4. Contribution of tourism to GDP in real terms is increased by at least 100%.	Tourism value added as a proportion of GDP	8.9.1

**Indicator 26: GDP Growth Rate****Indicator Reference: A1 – G4 – P1 – T1 – I26**

## DESCRIPTION

**Definition:**

GDP growth rate compares one year (or quarter) of a country's GDP with the previous year (or quarter) in order to measure how fast an economy is growing.

**Clarification**

Gross Domestic Product (GDP) is the total value of goods produced and services provided in a country during a year.

GDP growth rate is computed as the relative change of GDP between two successive time-periods

**Computation Formula**

$$\text{GDP Growth Rate} = \frac{\text{GDP } t1}{\text{GDP } t0}$$

Where:

t1 is the year under study, and

t0 is the year preceding the one under study

**Disaggregated by:** Sector (Agriculture, Health, Education, Mining, Tourism)

## PLAN FOR DATA ACQUISITION

**Data Collection method:**

Analyse secondary data e.g. from Ministry of Finance and Planning, IMF website

**Data Source:**

Records of National Treasury Departments, Ministries of Finance, Planning, Economic Development  
IMF data: <http://www.imf.org/external/data.htm>, African Union Commission, African Development Bank, Economic Commission for Africa.

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 27: Research and Development expenditure as a proportion of GDP****Indicator Reference: A1 – G4 – P2 – T1 – I27****DESCRIPTION****Definition:**

This is the proportion of total expenditure (current and capital) on R&D in the GDP.

**Clarification**

Research and development (R&D) comprises creative work undertaken on a systematic basis in order to increase the stock of human knowledge and to devise new applications based upon it. The term R&D covers three activities: basic research, applied research and experimental development. Basic research is experimental or theoretical work undertaken primarily to acquire new knowledge of the underlying foundation of phenomena and observable facts, without any particular application or use in view. Applied research is also original investigation undertaken in order to acquire new knowledge. It is, however, directed primarily towards a specific practical aim or objective. Experimental development is systematic work, drawing on existing knowledge gained from research and/or practical experience, which is directed to producing new materials, products or devices, to installing new processes, systems and services, or to improving substantially those already produced or installed.

This indicator is required to assess the level and trends of R&D expenditure in relation to GDP, at a given point of time. Adequate R&D funding that is commensurate with economic growth and national income is necessary for ensuring sustainable development. Scientists are improving their understanding on policy-relevant issues such as climate change, growth in resource consumption rates, demographic trends, and environmental degradation. Changes in R&D investments in these and other areas need to be taken into account in devising long-term strategies for development. Scientific knowledge should be applied to assess current conditions and future prospects in relation to sustainable development.

**Computation Formula**

$$\text{R\&D expenditure as a proportion of GDP} = \frac{\text{Gross Domestic Expenditure on R\&D}}{\text{Gross Domestic Product (GDP)}} \times 100$$

Gross domestic expenditure on R&D (GERD) activities is the total intramural expenditure on R&D performed within the national territory during a given period. This includes both current costs and capital expenditures. It includes R&D performed within a country and funded from abroad but excludes payments for R&D performed abroad.

Both data on R&D expenditure and GDP can be expressed in current values and in the national currency.

**Unit of measure:**

- Percentage

**Disaggregated by:**

- Sector of performance,
- Source of funds,
- Field of science,
- Type of research and
- Type of cost

**PLAN FOR DATA ACQUISITION****Data Collection methods:**

Data are collected through national R&D surveys, either by the national statistical office or a line ministry (such as the Ministry for Science and Technology)

**Data Source:**

- National R&D survey records at the ministry/department/council of science and technology and/or at the central statistical office and/or specialized institutions.
- Data on GDP can be obtained from either the ministry of finance or the central statistical office.

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

The indicator does not show the proportion of expenditure on R&D which contributes specifically to sustainable development. To date, most developed and a few developing countries are able to regularly collect and provide internationally comparable and timely data. Self funded research conducted by MA and PhD level as a source or level of funding isn't easy to trace.

This indicator is widely used to measure the so-called R&D intensity. However, it is not always the most appropriate indicator when measuring S&T in developing countries. Researchers as a percentage of population, labour force, or employment, might be more pertinent indicators, since they focus on human capacities and skills rather than on expenditure.

There are several weaknesses of measuring only expenditure. Expenditure does not reflect the potential of R&D in a given country, but only the effort conducted in a given year. As a single figure, it hides the question if this effort comes from government, private, or foreign sources. A significant part of expenditure corresponds usually to researchers' salaries, and these depend on the position of researchers in society and also the ups and downs of the economy, and in particular the public sector in developing countries. Data on expenditure can also be of poorer quality, since accounting systems are usually not well set up to reflect R&D. Also, inflation and the existence of vast informal sectors make the analysis of these figures more difficult.

At the national level, the availability of these data depends on the existence and frequency of R&D surveys.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 28: Manufacturing Value Added as percentage of GDP****Indicator Reference: A1 – G4 – P3 – T1 – I28****DESCRIPTION****Definition:**

Manufacturing value added (MVA) is the industry gross product less the intermediate inputs.

**Clarification**

Manufacturing refers to industries belonging to ISIC (International Standard Industrial Classification of All Economic Activities) divisions 15-37.

Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The origin of value added is determined by the International Standard Industrial Classification (ISIC), revision 3.

GDP is the standard measure of the value of final goods and services produced by a country during a period minus the value of imports. While GDP is the single most important indicator to capture these economic activities, it provides only a limited measure of people's material living standards.

MVA is a well-recognized and widely used indicator by researchers and policy makers to assess the level of industrialization of a country. MVA measures the contribution of manufacturing to economy. The indicator is exceptionally good for international comparison. Share of MVA in GDP establishes the role of manufacturing in the economy. In other words, this indicator specifies the contribution of the manufacturing sector to total production. MVA per capita is the basic indicator of a country's level of industrialization adjusted for the size of the economy. And finally, the MVA growth provides insight into the general direction and magnitude of growth of the manufacturing sector. In practice, it is a measure of the rate of change that an economy's MVA goes through from one year to another at constant prices.

**Computation Formula**

MVA (which is essentially the net output of the manufacturing sector) is generally compiled as the sum of the value added of all manufacturing activity units in operation in the reference period. It can be presented in percentage to gross domestic product (GDP) as well as per capita for any reference year. MVA growth rates are given at constant prices.

$$\text{MVA (as \% of GDP)} = \frac{(\text{Sum of value of all the outputs}) - (\text{value of intermediate inputs})}{\text{GDP}} \times 100$$

**Unit of measure:**

- Percentage

**Disaggregated by:****PLAN FOR DATA ACQUISITION****Data Collection method:**

- UNSDGs data

**Data Sources:**

- Analysis of secondary data eg UNIDO website: <http://www.unido.org/resources/statistics/statistical-databases.html>
- Records of Treasury departments, national bureaus of statistics, ministries of planning, economic development
- UNIDO - World MVA database, which contains data for about 200 economies (the data is presented at constant and current prices).

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 29: Tourism value added as a proportion of GDP****Indicator Reference: A1 – G4 – P4 – T1 – I29****DESCRIPTION****Definition:**

Tourism value added (TVA) is the total value of goods and services generated by the tourism sector net of intermediate consumption.

**Clarification**

Tourism comprises the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and purposes other than being employed in the place visited. This activity of visitors refers both to non-residents, residents travelling in the country of residence and abroad for tourism purposes (leisure and others) and it is conceptualized as inbound, domestic and outbound tourism, respectively. Although defined from the demand side, the economic analysis of tourism requires nevertheless the identification of the resources used by visitors on their trips, the consumption of goods and services that they acquire, and therefore the identification of the economic units that provide those goods and services. Both the demand and the supply perspectives are of particular importance. These sets of flows (both physical and monetary) impact different areas such as travelling, physical planning at destinations, employment and general economic performance, natural and cultural heritage. Consequently, tourism impacts upon the sustainability of national and local economies and the environmental and socio-cultural resource base.

GDP generated by visitor consumption is the most comprehensive aggregate illustrating the economic relevance of tourism. There is an increasing consensus on the importance of tourism as a strategic sector in the national economy insofar as it provides an essential contribution to the economic well-being of the resident population, contributes to the economic objectives of governments and shows its possible role as a relevant player in moving towards a more innovative economy. Presenting the economic contribution of tourism as a share of GDP shows the relative size of the tourism sector in the economy.

The value of the economic contribution of tourism captured by this indicator, and (relative) increases or decreases in it, could indicate the degree to which tourism is being successfully promoted. This indicator is useful for policy on tourism at national level and the level of sub-national regions as it gives the only credible measure of the economic contribution of tourism, which can be compared to GDP contributions of other economic activities. The indicator has been found especially useful in promoting and mainstreaming tourism in policy agendas at all levels. The indicator can also be compared across countries, although true international comparability of the figures needs to be improved.

**Computation Formula**

The formula for computing this indicator is as follows:

$$\frac{\text{Tourism Direct GDP}}{\text{GDP}} \times 100$$

**Unit of measure:**

- Percentage

**Disaggregated by:**

Tourism industries (e.g. accommodation for visitors, the different kinds of passenger transportation, etc.).

Sub-national disaggregation/estimates of Tourism Direct GDP

**PLAN FOR DATA ACQUISITION**

**Data Collection method:**

Data Needed to Compile the Indicator: arrivals of international visitors, trips by resident visitors in the country of reference, international departures by resident visitors, expenditure and production of goods and services demanded by visitors, tourism share values (how much value of the variable is attributable to visitor consumption), tourism related imported goods.

Physical indicators associated to the flow of visitors (number of tourism displacements – trips by overnight and same day visitors and their characteristics-, as well as overnights) continue to be basic of the measurement of tourism from the demand side, but it is no less true that countries now need additional information and indicators to improve the measurement of the economic contribution of tourism. Without doubt, the estimation of the expenditure associated to the different forms of tourism (inbound, domestic and outbound) is the main priority.

In the case of inbound and outbound tourism, the measurement and characterization of flows of visitors is usually based on that of non-residents entering the country for a duration of less than a year, and is performed at the borders, either using Entry/Departure cards, or using surveys at the borders usually at the moment the non-residents leave the country, although a few countries, combine in an integrated manner both instruments (administrative controls and surveys). Some countries, mainly from Europe where controls at the borders have disappeared, also make measurements in the place of accommodations (either as a complement to border surveys or as an alternative to them).

In the case of domestic tourism, as there are no borders to cross under administrative control, the observation of the flows of domestic tourism requires surveys and not just administrative procedures. UNWTO considers household surveys to be the most efficient and suitable instrument for measuring domestic tourism activity. Usually they use a stratified sample using demographic (size of habitat) and socio-economic criteria.

Daily average expenditure by visitors has to be estimated mainly using specific questions within a survey applied to visitors. Alternative estimation methods are different type of administrative data (such as bank reporting systems, transportation expenditures provided by companies or transportation regulatory authorities, etc.). In addition, some components might be estimated from other sources, as for instance those related to vacation homes, time-share and social transfers in kind.

Finally, estimation of total visitor consumption takes into account the number of trips (estimated by the arrivals/ departures of visitors) and the average daily expenditure by visitors. From the supply side, it should be remembered that in order for individuals to take tourism trips to a given country or location, an infrastructure or services must be in place to respond to their specific needs: basically this means that modes of transport and transportation facilities, different types of accommodation, food serving services, recreation facilities, as well as other services are in place. The measurement of tourism supply is therefore linked to the proportion of visitors' consumption of different types of industries output (not just tourism industries): estimation of tourism ratios is the key issue in this regard.

**Data Source:**

Countries' Tourism Satellite Account (TSA), which is a satellite account to the National Accounts  
 Website of United Nations Statistic Division: <http://unstats.un.org/unsd/tradeserv/tourism/manual.html>  
 Countries' macroeconomic studies on the economic importance of tourism

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

Some countries cannot produce TDGDP but have Tourism Direct Value Added (% Total Value Added), which can be used as an approximation.

The level of development of national systems of tourism statistics explains the basic limitations of Tourism GDP both in terms of number of information available and the coverage of basic variables. The reconciliation of information on consumption and supply in the economy is at the core of the TSA exercise.

**Actions Taken or Planned to Address Data Limitations:**

UNWTO recommends, when obtaining and disseminating tourism statistics, to be sure that the data present a basic structure of consistency, internally and with the representation of the remainder of the economy.

## Goal 5: Modern Agriculture for increased productivity and production

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Agricultural productivity and production	1. Double agricultural total factor productivity	Growth rate of yields for five national priority commodities	

**Indicator 30:** Growth rate of yields for five national priority commodities

**Indicator Reference:** A1 – G5 – P1 – T1 – I30

**DESCRIPTION**

**Definition:**

This is the production per unit area of the priority products. In most cases, yield data are obtained by dividing the production data by the data on area harvested (FAO).

**Clarification**

Total production of the individual commodity ( $P_{di}$ )

Production data refer to the actual harvested production from the field or orchard and gardens, excluding harvesting and threshing losses.

Production therefore includes the quantities of the commodity (crop, livestock products, fish etc) sold in the market (market production) and the quantities consumed or used by the producers (auto consumption)

Production of individual commodity is determined in metric tonnes (t)

Total size of the production unit for individual commodities ( $L_i$ )

Production unit can be expressed in terms of surface of land on which a crop is grown, cattle for livestock etc.

Size of production unit for individual commodities is expressed as hectare for crops, cattle for livestock etc

Yield ( $Y_i$ )

Total Production divided by total area for products

$$Y_i = P_{di} / L_i$$

Baseline value of the yield

$Y_{2013}$  The baseline value of the yield is an average of five year value from 2008 to 2013

**Computation Formula**

For a given year (t), the growth rate of yields for individual priority commodity (in %), is

$tYI_{it} = 100 \times (Y_t - Y_{2013}) / Y_{2013}$ ; and the indicator (overall growth rate) is:  $tYI = \text{average}(tYI_{it})$

**Disaggregated by:**

Agricultural sector (forestry, hunting, fishing, cultivation of crops, livestock production)

DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any)

**Actions Taken or Planned to Address Data Limitations:**

- This indicator is adopted from the CAADP set of indicators due to challenges faced by Member States in reporting on this indicator during the inaugural Agenda 2063 Continental reporting process.
- The 11 AU priority commodities are: Rice, Maize, Legumes, Cotton, Oil Palm, Beef, Dairy, Poultry and fisheries, Cassava, Sorghum and Millet

## Goal 6: Blue/ ocean economy for accelerated economic growth

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
Marine resources and Energy	At least 50% increase in value addition in the fishery sector in real term is attained by 2023	Fishery Sector value added (as share of GDP)	14.7.1
	Marine bio-technology contribution to GDP is increased in real terms by at least 50% from the 2013 levels	Marine biotechnology value added as a % of GDP	

**Indicator 31: Fisheries Sector Value added (as share of GDP)****Indicator Reference: A1 – G6 – P1 – T1 – I31****DESCRIPTION****Definition:**

Fisheries sector value added is the total value of goods and services in the fisheries sector net of intermediate consumption.

**Clarification**

Fishery is an activity leading to harvesting of fish and it may involve capture of wild fish or raising of fish through aquaculture. It is characterized by the categories of people involved, species or types of fish, area of water or seabed, method of fishing, class of boats, purposes of the activities or a combination of the foregoing features.

Fishery sector contribution to GDP refers to the sum of the value added (at basic prices) generated by all industries in response to fishery activities and the amount of net taxes on products and imports included within the value of this expenditure. Presenting the economic contribution of the fishery sector as a share of GDP shows the relative size of the sector in the economy. Most of the fisher folk in Member States where applicable are in the lower income bracket – tracking value addition in the sector could inform governments the level / kind of interventions that should be put in place to improve the lot of fisher folks.

**Computational Formula**

The formula for computing this indicator is as follows:

$$\frac{\text{Fishery contribution to GDP}}{\text{GDP}} \times 100$$

**Disaggregated by:**

- By fishery industries (e.g. catching or farming fish, processing activities, trade)

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Desk reviews of secondary data from relevant websites eg of FAO
- Extract data from national statistical reports

**Data Source:**

- FAO (FAOSTAT): <http://faostat3.fao.org/home/E>
- Ministry of Fisheries (when available)
- National Institute of Statistics (NIS)

**Frequency and Timing of Data Collection, Analysis:**

- Annual (ongoing)

**Frequency of Reporting:**

- National: Annual
- Continental/Regional: Biennial

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

Assessing this contribution in national accounts is generally limited to the primary sector, i.e. the catching or farming of fish through the first sale of fish products. To obtain an accurate estimate of the total value added by a given sector, it is necessary to take into account all activities, including those related to the secondary and tertiary sectors. In the case of fisheries, the secondary sector includes processing activities (drying, salting, smoking, freezing, etc.) and the tertiary are those related to trade (of fresh, processed and imported products) and catering.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 32: Marine-biotechnology value added (as share of GDP)****Indicator Reference: A1 – G6 – P1 – T2 – I32****DESCRIPTION****Definition:**

Marine-biotechnology contribution to GDP refers to the sum of the value added (at basic prices) generated by all industries in response to marine-biotechnology activities and the amount of net taxes on products and imports included within the value of this expenditure.

**Clarification**

This indicator provides an estimate of the relative importance of marine-biotechnology in the country's economy with regard to generating national income.

Marine-biotechnology is a collection of research and development (R&D) activities in the biological, chemical and environmental sciences that occur in or are related to the marine environment. It is the application of scientific and engineering principles to the processing of materials by marine biological agents to provide goods and services. Marine biotechnology can be thought of as the use of marine bio resources as the target or source of biotechnological applications. This broad understanding of marine biotechnology thus includes both traditional forms of marine biotechnology like aquaculture and modern forms such as bioremediation, production of biofuels and genetic modification of fish. The field has already yielded some notable and wide ranging advances in the fields of medicine, cosmetics, nutraceuticals, food production, and environ-industrial applications.

Bio-technology has been found to be a major source of income for member states especially those of the African Island States. In view of this it is becoming necessary for Member states to track their progress towards the reaping the potential from bio-technology sources

**Computation Formula**

$$\frac{\text{Marine biotechnology contribution to GDP}}{\text{GDP}} \times 100$$

**Disaggregated by:** None**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Desk review of secondary data extracted from Ministries' reports

**Data Source:**

- Ministry of Environment records

**Frequency of Reporting:**

- National: Annual
- Continental/Regional: Biennial

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

Identification of the scope of activities within the framework of marine-bio-technology is a challenge

**Actions Taken or Planned to Address Data Limitations:**

Capacity Building to be provided to Member States and RECs

## Goal 7: Environmentally sustainable climate resilient economies and communities

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Bio-diversity, conservation and sustainable natural resource management.	1. At least 30% of agricultural land is placed under sustainable land management practice	% of agricultural land placed under sustainable land management practice.	2.4.1
	2. At least 17% of terrestrial and inland water and 10% of coastal and marine areas are preserved	a) % of terrestrial and inland water areas preserved.	15.1.2
		b) % of coastal and marine areas preserved	14.5.1

**Indicator 33: Percentage of agricultural land placed under sustainable land management practice****Indicator Reference: A1 – G7 – P1 – T1 – I33****DESCRIPTION****Definition:**

This is the share of agricultural land under which sustainable land management practices are undertaken.

**Clarification**

Sustainable land management (SLM) requires the integration of technologies, policies and activities in the rural sector, particularly agriculture, in such a way as to enhance economic performance while maintaining the quality and environmental functions of the natural resource base.

Five criteria to evaluate progress towards SLM are:

- Productivity,
- Security,
- Protection,
- Viability and
- Acceptability

SLM is based on four common principles:

- Land-user-driven and participatory approaches
- Integrated use of natural resources at ecosystem and farming systems levels
- Multilevel and multi-stakeholder involvement
- Targeted policy and institutional support, including development of incentive mechanisms for SLM adoption and level

The objective of sustainable land management is to harmonize the complementary goals of providing environmental, economic and social opportunities for the benefit of present and future generations, while maintaining and enhancing the quality of the land (soil, water and air) resource. Land provides an environment for agricultural production, but it is also an essential condition for improved environmental management (source/sink functions for greenhouse gases, recycling nutrients, ameliorating and filtering pollutants, transmitting and purifying water as part of the hydrologic cycle, etc.)

**Computation Formula**

$$\% \text{ of agricultural land placed under SLM practice} = \frac{\text{Land on which practices contributing to environmental sustainability of agriculture are conducted}}{\text{Total Agricultural land}} \times 100$$

Where:

Agricultural land = Arable land and Permanent crops + Permanent meadows and pastures

Area on which are conducted practices contributing to environmental sustainability of agriculture = the surface area identified and/or acknowledged by the government as being affected by agronomic activities and practices that contribute to environmental sustainability of agriculture.

**Disaggregated by:** None**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Data will be extracted from national reports prepared by countries

**Data Source:**

- FAO
- National reports
- Satellite/GIS/Earth Observation
- Ministry of Agriculture and Environment

**Frequency and Timing of Data Collection, Analysis:**

- Annual (On-going)

**Frequency of Reporting:**

- National: Annual
- Continental/Regional: Biennial

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

At global level, currently there is no data available. However many if not most of the countries record areas which are the object of practices contributing to environmental sustainability under various schemes, either of a regulatory nature, like protected areas for instance, or as part of a subsidies scheme or in a payment for environmental services scheme or as part of voluntary standards, public or private.

Countries are also preparing, as part of national reports for the state of the world biodiversity for food and agriculture, statistics on practices contributing to biodiversity, most of which have a broader positive impact on the environment. Moreover, many countries are participating in internationally established strategic frameworks, which promote the collection of data at country level. Hence, the data for computing the indicator should be collected through the records that are held in the process of the country participation to those schemes and strategies.

**Actions Taken or Planned to Address Data Limitations:**

## Indicator 34: Percentage of terrestrial and inland water areas preserved

Indicator Reference: A1 – G7 – P1 – T2 – I34

### DESCRIPTION

#### Definition:

Percentage of terrestrial and inland water areas preserved is the total terrestrial and inland water areas preserved as a proportion of the total terrestrial area.

#### Clarification

Protected areas (marine, terrestrial or freshwater), as defined by the International Union for Conservation of Nature (IUCN), are clearly defined geographical spaces, recognized, dedicated and managed, through legal or other effective means, to achieve the long-term conservation of nature with associated ecosystem services and cultural values.

The status 'Designated' is attributed to a protected area when the management authority that according to national legislation or common practice (e.g. by means of an executive decree or similar) officially endorses a document of designation.

The World Conservation Union (IUCN) defines six management categories of protected areas. I. Protected area managed mainly for science of wilderness protection (e.g. Strict Nature Reserve/Wilderness Area) II. Protected area managed mainly for ecosystem protection and recreation (e.g. National Park) III. Protected area managed mainly for conservation of specific natural features (e.g. Natural Monument) IV. Protected area managed mainly for conservation through management intervention (e.g. Habitat/Species Management Area) V. Protected area managed mainly for landscape/seascape protection and recreation (e.g. Protected Landscape/Seascape) VI. Protected area managed mainly for the sustainable use of natural ecosystems (e.g. Managed Resource Protected Area).

#### Computation Formula

$$\frac{\text{Total terrestrial area preserved}}{\text{Total terrestrial area}} \times 100$$

#### Disaggregated by:

- Type of protected area

### PLAN FOR DATA ACQUISITION

#### Data Collection method :

- Secondary data

#### Data Source:

World Database on Protected Areas. <http://www.unep-wcmc.org/wdpa>

Major ecosystem and habitat classifications have been mapped for most regions and many countries. National classifications may not be compatible with other countries in their region, and few regional classifications are sufficiently detailed or accepted for national use. Global classifications are generally too coarse. Most countries keep statistics on protected areas, but their protected area systems may not be accurately mapped. However, the World Database on Protected Areas (WDPA) provides the most comprehensive dataset on protected areas worldwide and is managed by UNEP-WCMC in partnership with the IUCN World Commission on Protected Areas (WCPA) and the World Database on Protected Areas Consortium.

The WDPA is a fully relational database containing information on the status, environment and management of individual protected areas. This database includes information from countries, NGOs and academic institutions, international environmental conventions, etc. The WDPA enables searching of protected areas data by site name, country, and international programme or convention. It is possible to disaggregate the data in the WDPA by country and by IUCN Management Category, therefore it is suitable for this indicator. Data is currently available for over 110,000 protected areas worldwide. UNEP-WCMC provides online access to the WDPA Consortium 2006 World Database on Protected Areas web-download as part of a broad strategy to share conservation information. Statistical information produced for the WDPA 2006 CD-ROM which relate to WDPA datasets is also available in addition to information on the definitions and categorization of protected areas worldwide.

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

**Frequency of Reporting:**

- National: Annual
- Continental/Regional: Biennial

Reporting Responsibility: Member State

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

The indicator represents de jure not de facto protection. It does not indicate the quality of management or whether the areas are in fact protected from incompatible uses. It also gives a rather coarse picture of ecosystem protection. Additional detail would be needed to show the extent of disturbance of the ecosystem within each protected area, and coverage of rare or key ecological communities. Limitations to this indicator also include the lack of spatial data for many of the sites.

**Actions Taken or Planned to Address Data Limitations:**

**OTHER NOTES**

**Notes on Baselines/Targets:**

Well governed and effectively managed protected areas are a proven method for safeguarding both habitats and populations of species and for delivering important ecosystem services. Currently, some 13 per cent of terrestrial areas and 5 per cent of coastal areas are protected, while very little of the open oceans are protected. The current target of 10 per cent protection for each ecological region has been achieved in approximately 55 per cent of all terrestrial eco-regions. Therefore reaching this target implies a modest increase in terrestrial protected areas globally, with an increased focus on representativity and management effectiveness. It further implies that major efforts to expand marine protected areas would be required. A focus on representativity is crucial as current protected area networks have gaps, and some fail to offer adequate protection to many species and ecosystems. These gaps include many sites of high biodiversity value such as Alliance for Zero Extinction sites and Important Bird Areas. Particular emphasis is needed to protect critical ecosystems such as tropical coral reefs, sea-grass beds, deep water cold coral reefs, seamounts, tropical forests, peat lands, freshwater ecosystems and coastal wetlands.

**Indicator 35: Percentage of coastal and marine areas preserved****Indicator Reference: A1 – G7 – P1 – T2 – I35****DESCRIPTION****Definition:**

Percentage of coastal and marine preserved is the total marine areas set aside for preservation as a proportion of the total ecological region.

**Clarification**

A marine protected area is defined as: 'Any area of intertidal or sub-tidal terrain, together with its overlying water and associated flora, fauna, historical and cultural features, which has been reserved by law or other effective means to protect part or all of the enclosed environment' (IUCN, 1988). Only 'designated' protected areas are used in this calculation. In other words no 'Proposed' sites are included in the analysis.

The status 'Designated' is attributed to a protected area when the management authority that according to national legislation or common practice (e.g. by means of an executive decree or similar) officially endorses a document of designation. The marine area indicator can be disaggregated by country. It may also be desirable to disaggregate the indicator further, for example by different zones under national jurisdiction e.g. territorial waters and exclusive economic zones (where declared), and by protected area category (i.e. using the IUCN protected area management category system).

The World Conservation Union (IUCN) defines six management categories of protected areas. I. Protected area managed mainly for science of wilderness protection (e.g. Strict Nature Reserve/Wilderness Area) II. Protected area managed mainly for ecosystem protection and recreation (e.g. National Park) III. Protected area managed mainly for conservation of specific natural features (e.g. Natural Monument) IV. Protected area managed mainly for conservation through management intervention (e.g. Habitat/Species Management Area) V. Protected area managed mainly for landscape/seascape protection and recreation (e.g. Protected Landscape/Seascape) VI. Protected area managed mainly for the sustainable use of natural ecosystems (e.g. Managed Resource Protected Area).

## **ASPIRATION 2:**

**AN INTEGRATED CONTINENT,  
POLITICALLY UNITED AND  
BASED ON THE IDEALS OF PAN-  
AFRICANISM AND A VISION OF  
AFRICAN RENAISSANCE**

## Goal 8: United Africa (Federal or Confederate)

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Political and economic integration	1. Active member of the African Free Trade Area	Proportion of reported NTBs that are eliminated	
	2. Volume of intra-African trade is at least three times the 2013 level	Change in value of intra-African trade per annum	

## Indicator 37: Proportion of reported Non-tariff barriers (NTBs) that are eliminated

Indicator Reference: A2 – G8 – P1 – T1 – I37

### DESCRIPTION

#### Definition:

Proportion of reported Non-tariff barriers (NTBs) that are eliminated is the number of NTBs that were eliminated during the period under review as a fraction of the total number of reported NTBs

#### Clarification

Non-tariff barriers to trade (NTBs) are trade barriers that restrict imports or exports of goods or services through mechanisms other than the simple imposition of tariffs. They are represented by any obstacle to international trade that is not an import or export duty.

NTBs may take the form of import quotas, subsidies, customs delays, technical barriers, or other systems preventing or impeding trade. According to the World Trade Organization, non-tariff barriers to trade include import licensing, rules for valuation of goods at customs, pre-shipment inspections, rules of origin ('made in'), and trade prepared investment measures

The different types of NTBs are:

#### Licenses

Countries may use licenses to limit imported goods to specific businesses. If a business is granted a trade license, then it permits it to import goods that otherwise are restricted for trade in the country.

#### Quotas

Countries typically use quotas for the importing and exporting of goods and services. In nontariff barrier procedures, countries agree on specified limits of goods and services that are permitted for importation to a country, typically without restrictions, up to a specified limit. Quotas can also be set for specific time frames. Additionally, quotas are also often used in international trade license agreements.

#### Embargoes

Embargoes restrict the trade of specified goods and services. Embargoes are a measure used by governments for specific political or health circumstances.

#### Sanctions

Countries impose sanctions on other countries to limit their trade activity. Sanctions can include increased administrative actions and additional customs and trade procedures that slow or limit a country's ability to trade.

#### Voluntary Export Restraints

Voluntary export restraints are a type of nontariff barrier used by exporting countries. Voluntary export restraints set specified limits of goods and services to be exported to specified countries. These restraints are typically based on availability and political alliance.

#### Standard Tariffs

Nontariff barriers can be used in place of or in conjunction with standard tariff barriers, which are taxes that importing countries pay to exporting countries for goods or services. Tariffs are the most common type of trade barrier, and they increase the cost of goods and services for an importing country to the benefit of the exporting country.

#### Computation Formula

$$= \frac{\text{Total number of NTBs eliminated}}{\text{Total number of NTBs reported}} \times 100$$

**Disaggregated by:**

Reporting Responsibility: RECs

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 38: Percentage change in value of intra-African Trade****Indicator Reference: A2 – G8 – P1 – T2 – I38**

## DESCRIPTION

**Definition:**

This is the increase or decrease in the value of trade in goods and services between a Member State and other Member States over the previous year's figure

**Clarification**

This measures the change in intra-trade value in Africa.

The need to enhance intra-African trade among African countries led to the formation of the EAC-COMESA-SADC (East African Community; Common Market for Eastern and Southern Africa and the Southern Africa Development Community) Tripartite Free Trade Agreement, and later to the establishment of the Africa Continental Free Trade Area (AfCFTA).

**Computation Formula**

$$\% \text{ change in value of intra-African Trade} = \frac{x_i - x_0}{x_0} \times 100$$

where:

$x_i$  is the value of trade in goods and services between a country and others in the reporting year and  $x_0$  is the value of trade in goods and services between a country and others in the base year 2013

**Unit of measure:**

- Percentage

**Disaggregated** by: Type of goods / services,

## PLAN FOR DATA ACQUISITION

**Data Collection method:**

- Direct counting
- Document review

**Data Source:**

- Customs / Excise Reports

**Frequency and Timing of Data Collection, Analysis and Reporting:**

Reporting Responsibility: AUC

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):

It may be difficult to capture the exact volume of the intra African trade because a lot of the exchanges are done in the informal market or because countries have unreliable statistics.

Should services not be remove the definition and calculation it will be difficult to measure the volume of services. Ideally the value of services is more measurable.

**Actions Taken or Planned to Address Data Limitations:**

## Goal 9: Key Continental Financial and Monetary Institutions established and functional

<b>Indicator 42: Percentage of the progress made on the implementation of the African High Speed Rail Network</b>
<b>Indicator Reference: A2 - G10 – P1 – T2 – I40</b>
DESCRIPTION
<p><b>Definition</b></p> <p>The key components of national readiness for the implementation of the African High Speed Train Network include (i) Development of National Strategy for participation in the African High Speed Train Network – [Yi]; (ii) completion of coordinating arrangements with AUC – [Yii]; (iii) development of strategy implementation action plan – [Yiii]; (iv) resource mobilization plan – [Yiv] (v) securing of funds for project execution – [Yv]; (vi) construction in progress – [Yvi]; and (vii) construction completed [Yvii].</p> <p><b>Clarification</b></p> <p>One of the Flagship Programme of under Agenda 2063 – First Ten Year Implementation Plan is the linking of African cities by a high speed train network. Accordingly, AUC has set up a central coordinating body to oversee the execution of the assignment.</p> <p>Member States are to participate in the execution / attainment of that goal – as part of the continental integration Agenda.</p> <p><b>Computation Formula</b></p> <p>% of progress made on implementation of the African High Speed Rail Network = <math display="block">\frac{\text{No. of stages completed (among the 7 above)}}{7} \times 100</math></p>

<b>Indicator 43:</b> Number of Member States that have signed the solemn commitment to join the SAATM and implement all its measures
<b>Indicator Reference:</b> A2 - G10 – P1 – T3 - I43
<b>DESCRIPTION</b>
<p><b>Definition:</b></p> <p>Definition of new indicator here</p> <p><b>Clarification</b></p> <p>The Single African Air Transport Mechanism (SAATM) is one of the AU Protocols, specifically geared at enabling African Airlines to operate on the African continent, flying from country to country without hindrance.</p> <p>Open skies is an international policy concept that calls for the liberalization of the rules and regulations of the international aviation industry—especially commercial aviation—in order to improve competition</p> <p>This is to create a free-market environment for the airline industry in Africa. Its primary objectives are to liberalize the rules for international aviation markets and minimize government intervention as it applies to passenger, all-cargo, and combination air transportation as well as scheduled and charter services; and to adjust the regime under which military and other state-based flights may be permitted.</p> <p>Aspect of Agenda 2063 – Flagship Projects is free movement of people, goods and services. An open sky policy of Member States for African Airlines will contribute to the attainment of the free movement idea.</p> <p><b>Computation Formula</b></p> <p>Each Member State to be committed to SAATM needs to sign the following two instruments / declarations;</p> <p>a) Number of Member States that have signed the solemn Commitment to join the SAATM and implement all its concrete measures = No. of Member States.</p> <p>b) Number of Member States that have signed the Memorandum of implementation for the operationalization of SAATM = No. of Member States</p>

**Indicator 45: Proportion of population using mobile phones****Indicator Reference: A2 - G10 – P1 - T5 - I45****DESCRIPTION****Definition:**

This indicator is defined as the number of people using mobile phones as a percentage of the population

**Clarification**

Mobile phone users are individuals who have used a mobile phone (from any location) in the last 12 months.

Use of mobile phone is increasingly being seen as a utility like water and electricity. As a result national policies tend to support expansion in usage and coverage – hence the need for this indicator

**Computation Formula**

Proportion of population using mobile phones = 
$$\frac{\text{No. of persons with mobile phones}}{\text{Total eligible population (15+ year olds)}} \times 100$$

**Disaggregated by:** Age, Sex, Geographical Location (rural/urban).**PLAN FOR DATA ACQUISITION****Data Collection method**

- Review of Mobile Phone Companies reports
- Review of Communication Regulatory Bodies reports

**Data Source:**

- National Mobile Communications Regulatory Bodies Reports
- World bank : <http://data.worldbank.org/indicator/IT.NET.USER.P2>
- International Telecommunication Union, World Telecommunication/ICT Development Report and database, and World Bank estimates

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

<b>Indicator 46: Percentage contribution of ICT to GDP</b>
<b>Indicator Reference: A2 - G10 –P1 – T5 - I46</b>
<b>DESCRIPTION</b>
<p><b>Definition:</b></p> <p>ICT contribution to GDP refers to the sum of the value added (at basic prices) generated by all industries in response to ICT activities and the amount of net taxes on products and imports included within the value of this expenditure.</p> <p><b>Clarification</b></p> <p>ICT interventions have impact on productivity in many folds. As a results there is growing demand for ICT services in all sectors of the economy. There is a general consensus that this contribution should be captured and lessons learnt used to form the basis of formulating / implementing ICT interventions</p> <p><b>Computation Formula</b></p> $\frac{\text{ICT contribution to GDP}}{\text{GDP}} \times 100$
<p><b>Unit of measure:</b></p> <ul style="list-style-type: none"> <li>Percentage</li> </ul>
<b>Disaggregated by:</b> Type of connectivity
<b>PLAN FOR DATA ACQUISITION</b>
<p><b>Data Collection method:</b></p> <ul style="list-style-type: none"> <li>Document review</li> </ul>
<p><b>Data Source:</b></p> <ul style="list-style-type: none"> <li>Customs reports on imports of ICT gear</li> <li>World bank : <a href="http://data.worldbank.org/indicator/IT.NET.USER.P2">http://data.worldbank.org/indicator/IT.NET.USER.P2</a></li> <li>International Telecommunication Union, World Telecommunication/ICT Development Report and database, and World Bank estimates.</li> </ul>
<p><b>Frequency and Timing of Data Collection, Analysis and Reporting:</b></p> <ul style="list-style-type: none"> <li>Annual</li> </ul>
Reporting Responsibility: Member states
<b>DATA QUALITY ISSUES</b>
<p><b>Known Data Limitations and Significance (if any):</b></p> <p>Very difficult to get an estimate that reflects the true impact / value addition of ICT to GDP because of the absences of a stand-alone ICT sector ( other than setting up ICT production equipment and software firms which are very far-fetched in most African Countries)</p>
<b>Actions Taken or Planned to Address Data Limitations:</b>

## **ASPIRATION 3:**

**AN AFRICA OF GOOD  
GOVERNANCE, DEMOCRACY,  
RESPECT FOR HUMAN RIGHTS,  
JUSTICE AND THE RULE OF  
LAW**

**Goal 11: Democratic values, practices, universal principles of human rights, justice and the rule of law entrenched**

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Democratic Values and Practices are the Norm	1. At least 70% of the people believe that they are empowered and are holding their leaders accountable	% of people who believe that there are effective mechanisms and oversight institutions to hold their leaders accountable	16.7.2
	2. At least 70% of the people perceive that the press / information is free and freedom of expression pertains	% of people who perceive that there is freedom of the press	16.10.1
	3. At least 70% of the public perceive elections are free, fair and transparent	% of people who believe that the elections are free, fair and transparent	16.6.1
	4. African Charter on Democracy is signed, ratified and domesticated by 2020	Extent to which the African Charter on democracy has been domesticated	

<b>Indicator 47: Percentage of people who believe that there are effective mechanisms and oversight institutions to hold their leaders accountable</b>
<b>Indicator Reference: A3 – G11 – P1 – T1 – I47</b>
<b>DESCRIPTION</b>
<p><b>Definition:</b></p> <p>The number of youth and adults who believe that mechanisms and oversight institutions exist to hold their leaders accountable - as a proportion of the total population of youth and adults</p> <p><b>Clarification</b></p> <p>In most countries youth / adults are all eligible voters by age.</p> <p>Some of the mechanisms for holding their leaders accountable include (i) free, fair and credible electoral systems for all levels of government (ii) town house meetings between leaders and the people (iii) press conferences where leaders could be questioned to account for their stewardship (iv) parliamentary accountability public hearings / questioning of leaders in the Executive Branch etc.</p> <p>Oversight institutions could include – depending on the country - (i) human rights and administrative justice institutions (ii) independent judiciary / courts (iii) an independent prosecutorial service (iv) free and vibrant press (v) freedom of information laws (vi) the legislature.</p> <p><b>Computation Formula</b></p> $\frac{\text{No. in the sample who believe that mechanisms and oversight institutions exist}}{\text{Total sample size}} \times 100$

## Goal 15: A Fully Functional and Operational African Peace and Security Architecture

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Operationalization of APSA Pillars	1. National Peace Council is established by 2016	Existence of an operational national peace council.	

**Indicator 54: Existence of an operational national peace council****Indicator Reference: A4 – G15 – P1 – T1 – I54****DESCRIPTION****Definition:**

National Peace Council is an independent national institution whose aim is to raise awareness surrounding the use of non-violent strategies in response to conflict through networking, coordination and campaigning.

A functional national peace council requires to be legislated and institutionalized by the national legislative structures. The council is well resourced with a clear mandate and implementation strategy.

The analysis of this indicator will be based on the different stages of establishment of the national peace council to address conflict prevention and peace building in accordance with APSA. The stages are:

Stage 0: No NPC established

Stage 1: NPC established and institutionalized but not active

Stage 2: NPC established and partially active. A few APSA pillars adopted and implemented

Stage 3: NCP established and fully implementing the APSA pillars

**Clarification**

National Peace Councils, creations under the African Peace and Security Architecture at member state level take preventive and mediating measures to avoid / resolve conflicts between political parties, ethnic groups, religious groups etc

Its creation at the national level is required under the African Peace and Security Architecture which is part of the African Agenda 2063 – FTYIP.

**Computation Formula**

Existence (Yes / No) of a national peace council

**PLAN FOR DATA ACQUISITION****Data Collection method:**

1. Document Review
2. Interviews with key respondents

## **ASPIRATION 5:**

**AFRICA WITH A STRONG  
CULTURAL IDENTITY, COMMON  
HERITAGE, VALUES AND  
ETHICS**

## Goal 16: African Cultural Renaissance is Pre-eminent

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Values and Ideals of Pan Africanism	1. At least 60% of content in educational curriculum is on indigenous African culture, values and language targeting primary and secondary schools	Proportion of the content of the curricula on indigenous African culture, values and language in primary and secondary schools	

**Indicator 55:** Proportion of subjects in primary and secondary school curricula with content on indigenous African culture, values and languages

**Indicator Reference:** A5 – G16 – P1 – T1 – I55

#### DESCRIPTION

##### **Definition:**

This is the ratio of the total number of subjects with content on indigenous African culture, values and language in primary and secondary schools as a percentage of the total number of subjects offered.

##### **Clarification**

The curriculum is made up of subjects. The content of each subject should be assessed to determine the extent to which the element of African values, culture and language are considered.

The Continental Education Strategy for Africa (CESA 16-25) strongly advocates the need for African values and ethics be introduced into the school curriculum. This is also corroborated by Aspiration 5 of Agenda 2063.

##### **Computation Formula**

$$\frac{\text{Number of subjects with indigenous African culture, values and language}}{\text{Total number of subjects offered}} \times 100$$

##### **Unit of measurement**

- Percentage

##### **Disaggregated by:**

- Level (Primary/Secondary)
- Type of institutions (Public/Private)

#### PLAN FOR DATA ACQUISITION

##### **Data Collection method:**

- Document review
- Interviews
- Surveys

##### **Data Source:**

- Ministries of Education's reports and surveys
- Ministries responsible for culture and heritage
- National parents and teachers associations
- African Academy of Languages (ACALAN)

##### **Frequency and Timing of Data Collection, Analysis and Reporting:**

**Reporting Responsibility:** Member State

#### DATA QUALITY ISSUES

##### **Known Data Limitations and Significance** (if any):

- Variations between country in assessing subjects with content on indigenous African content.

##### **Actions Taken or Planned to Address Data Limitations:**

- Training of Member States
- Strengthening of national Education Management Information Systems (EMIS) ecosystems

## **ASPIRATION 6:**

**AN AFRICA WHOSE  
DEVELOPMENT IS PEOPLE  
DRIVEN, RELYING ON THE  
POTENTIAL OF THE AFRICAN  
PEOPLE**

## Goal 17: Full Gender Equality in All Spheres of Life

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Women Empowerment	1. Equal economic rights for women, including the rights to own and inherit property, sign a contract, save, register and manage a business and own and operate a bank account by 2026	Proportion of women in total agricultural population with ownership or secure rights over agricultural land	5.a.1
	2. At least 30% of all elected officials at local, regional and national levels are Women as well as in judicial institutions	Proportion of seats held by women in national parliaments, regional and local bodies	5.5.1
2. Violence & Discrimination against Women and Girls	1. Reduce 2013 levels of violence against women and Girls by at least 20%	Proportion of women and girls subjected to sexual and physical violence	5.2.1
	2. Reduce by 50% all harmful social norms and customary practices against women and girls and those that promote violence and discrimination against women & girls	Proportion of girls and women who have undergone female genital mutilation/ cutting	5.3.2
	3. Eliminate all barriers to quality education, health and social services for Women and Girls by 2020	Proportion of children whose births are registered in the first year	16.9.1

**Indicator 56:** Proportion of women in total agricultural population with ownership or secure rights over agricultural land

**Indicator Reference:** A6 – G17 – P1 – T1 – I56

**DESCRIPTION**

**Definition:**

Total number of women farmers relative to the entire agricultural population that are owners or with secure rights to agricultural land.

**Clarification**

Ownership could be through inter-generational land inheritance with or without a legal title deed.

Secure rights to the land could be through terminal lease arrangements or outright sale of the land

The agricultural population comprise all persons engaged in full or part time farming

This indicator tracks the level of inclusiveness of women in the ownership of land as an assets by all farmers. This serves as a proxy measure for women empowerment – featured as an implicit goal of Agenda 2063 First Ten year Implementation Plan.

**Computation Formula**

$$\frac{\text{Total number of women farmers who own land or have secure rights to the land}}{\text{Total number of farmers who own land or have secure rights to agric. land}} \times 100$$

**Disaggregated by:**

**PLAN FOR DATA ACQUISITION**

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 60:** The proportion of children whose births are registered within the first year

**Indicator Reference:** A6 – G17 – P2 – T3 – I60

**DESCRIPTION**

**Definition:**

Proportion of children under 1 year of age whose births have been registered with a civil authority

**Clarification**

Birth registration is an official record of a child's existence. The registration of child birth is typically a step towards ensuring the rights of all children. An unregistered child is vulnerable of being denied the rights to an official identity and nationality. Registration of a child is an essential contribution to realising children rights and provides the foundation for ensuring appropriate education, health and labour rights.

The measurement facilities issue of identity cards, estimation of the population, educational planning in early childhood education etc.

**Computation Formula**

$$\frac{\text{No. of children aged 0 to 1 whose births are registered within the first year}}{\text{Total No. of children aged 0 – 1 years}} \times 100$$

- CRVS is not well developed in most African countries

**Actions Taken or Planned to Address Data Limitations:**

## Goal 18: Engaged and Empowered Youth and Children

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Youth Empowerment and Children's Rights	1. Reduce 2013 rate of youth unemployment by at least 25%; in particular female youth	Unemployment rate of youth	8.5.2
	2. End all forms of violence, child labour exploitation, child marriage and human trafficking	% of children engaged in child labour	8.7.1
		% of children engaged in child marriage	5.3.1
		% of children who are victims of human trafficking	16.2.2
	3. Full implementation of the provision of African Charter on the Rights of the Youth is attained	Level of implementation of the provisions of the African Charter on the Rights of the Youth by Member States	

**Indicator 61: Unemployment rate among the youth****Indicator Reference: A6 – G18 – P1 – T1 - I61****DESCRIPTION****Definition:**

Youth unemployment rate is the number of unemployed youth as a percentage of the total number of youth, where the latter consists of the unemployed plus those in paid or self-employment.

**Clarification**

According to the International Labour Organization (ILO) definition of unemployment, the “unemployed” comprise all persons above the age specified for measuring the economically active population, who during the reference period satisfy the following three conditions simultaneously:

- “Without work” i.e., not in paid employment or self-employment, as specified by the international definition of employment;
- “Currently available for work” i.e., available for paid employment or self-employment during the reference period (or shortly after); and
- “Seeking work” i.e., had taken specific steps in a specified recent period (typically the last four weeks) to seek paid employment or self-employment.

A special provision applies to persons without work who made arrangements to start work at a date subsequent to the reference period (future starts). These persons are classified as “unemployed” irrespective of their job-search activity, provided they were without work during the reference period and currently available for work.

“Seeking work” means taking active steps to look for work such as registration at public or private employment exchanges, direct application to employers, checking at worksites, farms, factory gates, market or other assembly places, placing or answering newspaper advertisements, seeking assistance of friends or relatives, looking for financial resources, land, building, machinery or equipment, or permits or licenses to establish own enterprise.

**Computation Formula**

$$\text{Youth unemployment rate} = \frac{\text{Number of unemployed youth}}{\text{Total number of people of youth}} \times 100$$

**Unit of measurement:**

- Person(s)

**Disaggregated by:**

- Age group
- Sex: Male, Female
- 

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Download from Sector Ministry annual statistics reports or consult National Statistical Office
- Download from International Labour Organization’s online database

**Data Source:**

- Household surveys
- National publications
- International Labour Organization's online database:
- [http://www.ilo.org/ilostat/faces/oracle/webcenter/portalapp/pagehierarchy/Page137.jspx?\\_afzLoop=18902207419471&clean=true#%40%3F\\_afzLoop%3D18902207419471%26clean%3Dtrue%26\\_adf.ctrl-state%3D66gebznrw\\_163](http://www.ilo.org/ilostat/faces/oracle/webcenter/portalapp/pagehierarchy/Page137.jspx?_afzLoop=18902207419471&clean=true#%40%3F_afzLoop%3D18902207419471%26clean%3Dtrue%26_adf.ctrl-state%3D66gebznrw_163)

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

Reporting Responsibility: Member States

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance** (if any):

When unemployment is high, some people become discouraged and stop looking for work; they are then excluded from the labour force. This implies that the unemployment rate may fall, or stop rising, even though there has been no underlying improvement in the labour market.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 62: Percentage of Children engaged in Child Labour****Indicator Reference: A6 – G18 – P2 – T2 – I62****DESCRIPTION****Definition:**

Total number of children who are working relative to the total number of children ( including those working and not working).

**Clarification**

According to Article 2 of the Africa Charter on Children rights and welfare of the child, a child is every human being below the age of 18 years.

**Computation Formula**

$$\frac{\text{Total number of children who are working}}{\text{Total number of children}} \times 100$$

**Unit of measurement:**

- Person(s)

**Disaggregated by:**

- Age
- Sex:
- Vulnerability: Vulnerable populations include disabled, LGBT, indigenous people, religious and ethnic minorities

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- National Statistical Office
- UNICEF data base
- ILO database
- Ministry of social welfare and community development reports – where applicable

**Data Source:**

- Labour surveys
- Agricultural surveys
- UNICEF Reports
- ILO
- Sector Ministry Reports

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Annual

Reporting Responsibility: Member States

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):****Actions Taken or Planned to Address Data Limitations:**

**Indicator 63: Percentage of children engaged in child marriage****Indicator Reference: A6 – G18 – P2 – T2 – I63****DESCRIPTION****Definition:**

Proportion of children under 18 years of age who are married or in a union

**Clarification**

According to Article 2 of the Africa Charter on rights and welfare of the child, a child means every human being below the age of 18 years.

This indicator will track how governments address harmful social and cultural practices such as child marriage that affects the welfare and dignity of the child. Early marriage is a marriage that occurs before the person reaches 18 years, it is a practice where one or both spouses are below the age of 18.

**Computation Formula**

$$\frac{\text{Number of children married under 18 years}}{\text{Total number of children in the population}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Sex
- Urban / rural

**PLAN FOR DATA ACQUISITION****Data Collection method :**

- Conducting survey

**Data Source:**

- Reports of the Ministries of Social Welfare and Community Development / CSOs / NGOs

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

Reporting Responsibility: Member States

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 64: Percentage of children who are victims of human trafficking****Indicator Reference: A6 – G18 – P2 – T2 – I64****DESCRIPTION****Definition:**

Proportion of children who fall victim to the ills of human trafficking

**Clarification**

Trafficking of children includes recruitment, transportation, transfer and receipt of a child under the age of 18 for exploitation purposes.

The rights of the child as enshrined in the African Charter on the Rights of the Child requires Member States to initiate / implement policies that will prevent the child being abused / taken advantage of through trafficking

**Computation Formula:**
$$\frac{\text{No. of children who are victims of human trafficking}}{\text{Total number of children in the population}} \times 100$$
**Unit of measurement:**

- Number

**Disaggregated by:**

- Sex
- Age

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Document Reviews

**Data Source:**

- Immigration Reports
- Police Reports

- UNODC
- CSOs and NGOs
- Child welfare offices

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

Reporting Responsibility: Member States

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):**

The data does not take into account victims that were not detected within the national boundary – either being taken out or being brought in.

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 65:** Level of implementation of the provisions in the African Charter on the Rights of the Youth by Member States

**Indicator Reference:** A6 – G18 – P3 – T1 – I65

**DESCRIPTION**

**Definition:**

This indicator measures the extent to which member states have been able to implement the provision of the African Youth Charter.

**Clarification**

This will include tracking the extent to which Member States have undertaken the levels of implementation, including:(i) signing and ratification and (ii) domestication (planning and budgeting).

According to the African Youth Charter, youth or young people refers to every person between ages of 15 & 35.

**Computation Formula**

There are two components , namely signing / ratification and domestication. Each carries 50% compliance. When both are complied with, the level is 100%.

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Country
- Level of implementation

**PLAN FOR DATA ACQUISITION**

**Data Collection method :**

- Review of legislative records
- Review of Budgets

**Data Source:**

- Legislative reports
- Reports of ministries responsible for the Youth
- Budget allocations
- Expenditure reports

**Frequency and Timing of Data Collection, Analysis and Reporting:** Periodic where necessary

Reporting Responsibility: Member States

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

- According to the definition the country can score 100 percent by signing and ratifying without implementation.

**Actions Taken or Planned to Address Data Limitations:**

## **ASPIRATION 7:**

# **AFRICA AS A STRONG AND INFLUENTIAL GLOBAL PARTNER**

## Goal 19: Africa as a major partner in global affairs and peaceful co-existence

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Africa's place in global affairs	1. National systems or infrastructure for research and development that will contribute to the stock of global intellectual property rights is fully functional	Availability of national legislation on statistics that complies with fundamental principles of official statistics	17.18.2
		Proportion of funding allocated for the implementation of functional statistical system	17.8.3
		Existence of formal institutional arrangements for the coordination of the compilation of official statistics	17.8.1

**Indicator 66:** Availability of national legislation on statistics that complies with fundamental principles of official statistics

**Indicator Reference:** A7 – G19 – P1 – T1 – I66

**DESCRIPTION**

**Definition:**

This indicator is defined as the existence of national statistical legislations that fully adhere to the fundamental principles of official statistics (*please see below the ten fundamental principles of official statistics*).

**Clarification**

Statistical legislation of any country plays a significant role in producing harmonised, reliable and quality data on a timely basis.

The ten fundamental principles of official statistics are:

**1. Relevance, impartiality and equal access:** Official statistics provide an indispensable element in the information system of a democratic society, serving the government, the economy and the public with data about the economic, demographic, social and environmental situation. To this end, official statistics that meet the test of practical utility are to be compiled and made available on an impartial basis by official statistical agencies to honour citizens' entitlement to public information.

**2. Professional standards and ethics:** To retain trust in official statistics, the statistical agencies need to decide according to strictly professional considerations, including scientific principles and professional ethics, on the methods and procedures for the collection, processing, storage and presentation of statistical data.

**3. Accountability and transparency:** To facilitate a correct interpretation of the data, the statistical agencies are to present information according to scientific standards on the sources, methods and procedures of the statistics.

**4. Prevention of misuse:** The statistical agencies are entitled to comment on erroneous interpretation and misuse of statistics.

**5. Sources of official statistics:** Data for statistical purposes may be drawn from all types of sources, be they statistical surveys or administrative records. Statistical agencies are to choose the source with regard to quality, timeliness, costs and the burden on respondents.

**6. Confidentiality:** Individual data collected by statistical agencies for statistical compilation, whether they refer to natural or legal persons, are to be strictly confidential and used exclusively for statistical purposes.

**7. Legislation:** Laws, regulations and measures under which the statistical systems operate are to be made public.

**8. National coordination:** Coordination among statistical agencies within countries is essential to achieve consistency and efficiency in the statistical system.

**9. Use of international standards:** The use by statistical agencies in each country of international concepts, classifications and methods promotes the consistency and efficiency of statistical systems at all official levels.

**10. International cooperation:** Bilateral and multilateral cooperation in statistics contributes to the improvement of systems of official statistics in all countries.

**Computation Formula:**

At national level, the computation formula is: Availability of legislation on statistics (Yes / No)

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- 

**Reporting Responsibility:** AU Member States

**PLAN FOR DATA ACQUISITION****Data Collection method:**

- Review of legislative instruments

**Data Source:**

- Reports of National Statistical Offices
- Legislative Reports

**Frequency and Timing of Data Collection, Analysis and Reporting:**

- Periodic

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):

Some countries may not avail the data because they are still in the process of reviewing their legislations

**Actions Taken or Planned to Address Data Limitations:**

**Indicator 67:** Proportion of national budget allocated for implementation of functional statistical System

**Indicator Reference:** A7 – G19 – P1 – T1 – I67

**DESCRIPTION**

**Definition:**

Proportion of funding allocated for the implementation of functional statistical system is defined as the percentage of the national budget allocated to support the functioning of the national statistical systems

The components of the national budget include:

- Allocations to the National Statistical Services
- Allocations to sector ministries for the collection and storage of administrative data
- Allocations of regional and local government authorities for the collection of administrative data

A structure of a functioning national system is defined by its service delivery model. Some national statistical offices have decentralized offices who collect field information and send it to the national office for collation / storage etc. Some national statistical offices have a few field offices and relies on sector ministries and local governments in the collection of data through administrative procedures

National Plans under pinned by The Agenda 2063 First Ten Year Implementation Plan results framework must be monitored and evaluated. Functioning national statistical systems are key to such and endeavour

**Clarification:**

According to the AU decision, Member States are required to allocate at least 0.15% of their national budget to their national statistical systems.

**Computation:**

The total budget allocated to the national statistical system  
$$\frac{\text{Total budget allocated to the national statistical system}}{\text{Total national budget}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- National level
- Sector Ministry level
- Local government level

**PLAN FOR DATA ACQUISITION**

**Data Collection method :**

- Review of budget / allocations

**Data Source:**

- Ministry of Finance budgetary allocation documents
- Sector ministries budget allocations
- Regional and local government budgetary allocations
- National parliament

**Frequency and Timing of Data Collection, Analysis and Reporting:** Annual

**Reporting Responsibility:** Member States

**DATA QUALITY ISSUES**

**Known Data Limitations and Significance (if any):**

**Indicator 68:** Existence of formal institutional arrangements for the coordination of the compilation of official statistics

**Indicator Reference:** A7 – G19 – P1 – T1 – I68

**DESCRIPTION**

**Definition:**

Existence of formal institutional arrangements for the coordination of the compilation of official statistics is defined as the formal institutional arrangement for the management of official national statistics and is comprised of Statistical legislation, the Oversight Board and an Executing Agency.

**Clarification**

None

**Computation Formula**

Each of the three components, namely Statistical legislation, the Oversight Board and an Executing Agency, is assigned a percentage of 33.33. Counting the number that is in place multiplied by 33.33% will give the “level” of existence.

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Ther three components

**PLAN FOR DATA ACQUISITION**

## Goal 20: Africa takes full responsibility for financing her development

Agenda 2063			Corresponding SDG Indicator
Priority area	Target	Indicator	
1. Capital Markets	1. National capital market finances at least 10% of development expenditure	Proportion of public sector budget funded by national capital markets	17.1.1
2. Fiscal system and Public Sector Revenues	2. Tax and non-tax revenue of all levels of government should cover at least 75% of current and development expenditure	Total tax revenue as a % GDP	17.1.2
3. Development Assistance	3. Proportion of aid in the national budget is at most 25% of 2013 level	Total ODA as a percentage of the national budget	17.3.1
		Resources raised through innovative financing mechanisms as a % of national budget	

**Indicator 69: Proportion of public sector budget funded by national capital markets****Indicator Reference: A7 – G20 – P1 – T1 – I69****DESCRIPTION****Definition:**

This is the total funding obtained from domestic markets for long term debts relative to the size of the national development budget

**Clarification**

- Long term debts have maturity periods of above 12 months ( 1 years)
- Long term capital markets comprise the equity (stock) and bond ( debt) markets
- For development funding, the debt market is the one with focus on
- The national development budget is the total national budget less recurrent component of the budget

Africa must finance her own development – that is one of the catch phrases of Agenda 2063. Every effort should be made by member states to grow the domestic capital market to finance national development. This indicator tracks such efforts

**Computation Formula:**
$$\frac{\text{Total funds raised from the domestic capital market}}{\text{Total public sector budget}} \times 100$$
**Unit of measurement:**

- Percentage

**Disaggregated by:**

- Source

**PLAN FOR DATA ACQUISITION****Data Collection method :**

- National: Annual
- Continental/Regional: Biennial

Reporting Responsibility: Member States

**DATA QUALITY ISSUES****Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 70: Total tax revenue as a percentage of GDP****Indicator Reference: A7 – G20 – P2 – T1 – I70**

## DESCRIPTION

**Definition:**

According to OECD, tax revenue is defined as the revenue collected from taxes on income and profits, social security contribution, taxes levied on goods and services, payroll taxes, taxes on the ownership and transfer of property and other taxes. Total tax revenue as a percentage of GDP indicates the share of a country's output that is collected by government through taxes.

**Clarification**

Gross domestic product (GDP) is the market value of all officially recognized final goods and services produced within a country in a year.

The indicator tracks the extent to which the Government is succeeding with respect to increase in the effectiveness and efficiency of the national tax collection system; it also tracks the level of net output that is available to the government – in the form of revenues

**Computation Formula:**

$$\frac{\text{Total taxes collected}}{\text{GDP}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:** N/a

## PLAN FOR DATA ACQUISITION

**Data Collection method :**

- Review of Revenue Authority / Ministry of Finance on tax revenues

**Data Source:**

## DATA QUALITY ISSUES

**Known Data Limitations and Significance** (if any):**Actions Taken or Planned to Address Data Limitations:**

**Indicator 71: Total ODA as a percentage of the national budget****Indicator Reference: A7 – G20 – P3 – T1 – I71****DESCRIPTION****Definition:**

Total of all sources of official development assistance as defined below relative to the size of the national budget.

**Clarification**

ODA is defined as:

Flows of official financing administered with the promotion of the economic development and welfare of developing countries as the main objective, and which are concessional in character with a grant element of at least 25 percent (using a fixed 10 percent rate of discount). By convention, ODA flows comprise contributions of donor government agencies, at all levels, to developing countries (“bilateral ODA”) and to multilateral institutions. ODA receipts comprise disbursements by bilateral donors and multilateral institutions.

Source: *OECD, Glossary of Statistical Terms* <sup>[2]</sup>

There are three key elements of the ODA architecture :

- The cooperating national agency must be a public sector in nature
- The objective of the aid will be to support the promotion of economic development and welfare
- It is granted at concessional financial terms ( e.g. if it is a loan there should be a grant element of at least 25%)

There is an emerging consensus that reliance on ODA by developing countries leads to aid dependency and at times it does not address the national priorities. Aid dependency also comes with conditionalities which could slow the growth potential of the country.

Agenda 2063 FTYIP requires that Member States explore avenues for increased domestic / innovative financing – and minimize dependency on ODA. This indicator will enable Member States to track how far they are succeeding in reducing aid-dependency and hence accelerating their growth potential within the context of the execution of the FTYIP.

**Computation Formula:**

Total of all sources of official development assistance as defined above X 100  
 \_\_\_\_\_  
 Total of all sources of funds – required to execute the budget

**Unit of measurement:**

- Percentage

**Disaggregated by:**

- N/a

**PLAN FOR DATA ACQUISITION****Data Collection method :**

- National: Annual
- Continental/Regional: Biennial

Reporting Responsibility: Member States

**DATA QUALITY ISSUES****Known Data Limitations and Significance (if any):****Actions Taken or Planned to Address Data Limitations:**

**Indicator 72:** Resources raised through innovative financing mechanisms as a percentage of national budget

**Indicator Reference:** A7 – G20 – P3 – T1 – I72

**DESCRIPTION**

**Definition:**

According to the World Bank, innovative financing refers to a range of non-traditional mechanisms to raise additional funds for development through innovative projects, micro-contributions, Public Private Partnerships (PPPs) and market based financial transactions.

**Clarification**

Member states are being urged to reduce their dependency on ODA for financing development- to minimise aid dependency. Innovative sources of financing as defined above provide the flexibility for member states to match their priorities to other potential sources of funding. The indicator is expected to help member states track the progress at which they are making on innovative financing

**Computation Formula**

$$\frac{\text{Total of all sources of innovative financing as defined above}}{\text{Total of all sources of funds – required to execute the budget}} \times 100$$

**Unit of measurement:**

- Percentage

**Disaggregated by:** n/a
